	Acknowledgement	iii
	Executive Summary	iv
1	Introduction and Background	
1.1	Background of IWMP	01
1.5	Watershed - Sandwa Chandrika	02
2	Objectives and Project Implementing Agency (PIA)	
2.1	Major objectives	04
2.2	Project Implementing Agency (PIA)	04
3	Present scenario of the watershed	
3.1	General profile of the watershed	05
3.2	Village wise land use of the watershed	07
3.3	Watershed maps	12
3.3.1	Base map	12
3.3.2	Slope map	13
3.3.3	Contour map	14
3.3.4	Drainage map – Seasonality	15
3.3.5	Drainage map - Stream order map	16
3.3.6	Soil Map	17
3.3.7	Land Capability Map	18
3.3.8	Land degradation map	19
3.3.9	Landuse Map	20
3.3.10	Ground water level map	21
3.4	Climate	23
3.5	Natural calamities	24
3.6	Physio-graphy and Soils	24
3.7	Hydrology	26
3.8	Human population	27
3.9	Literacy rate	30
3.10	Socio-economic aspects	31
3.11	Details of farming community, land less families and families below poverty line	32
3.12	Details about social categories of farmers	33
3.13	Details about social categories of farmers based on gender	36
3.14	Details about occupation	39
3.15	Details about land holding	42

3.16	Details about livelihood activities	43
3.17	Details about fuel used for cooking meal	45
3.18	Details of migration	47
3.19	PRA (Participatory Rural Appraisal)	48
3.20	List of agencies/projects/schemes presently working in the watershed	48
3.21	Peoples Institution	49
3.22	List of UGs formed	49
3.23	List of members of the Watershed Committee (WC)	49
3.24	Gram Panchayat wise area under different crops	51
3.25	Existing Engineering Works	52
3.26	Details of Common Property Resources (CPR)	53
3.27	Existing package of practices of crops	54
3.28	Existing crop rotation	55
3.29	Existing Package of practices of orchard	56
3.30	Livestock population	57
3.31	Average productivity of field crop /animal	58
3.32	Animal productivity	59
3.33	Existing avenue trees in the Gram Panchayat	60
3.34	Status of existing farm machinery and equipments	61
3.35	Bench marking of project area	62
4	The problems and need of the area	
4.1	Crop productivity/soil and land degradation and soil and water conservation problems	64
4.2	Socio-economical problems	66
4.2.1	Details of SWOT analysis	67
4.3	Strategic Options	72
5	Recommended management programme	74
6	Proposed interventions	
6.1	Soil management and landuse	75
6.2	Efficient use of water resources and management	76
6.3	Seed and planting material	76
6.4	Technology Dissemination	77
6.5	Farm mechanization	78
6.6	Horticulture	79
6.7	Commercial fruits	80
6.8	Proposed intervention for livestock	81
6.9	Works under Production system	83
6.9.1	Proposed grampanchayat wise area under demonstration (ha)	83
6.9.2	Cost of Crop production system intervention	85
6.9.3	Area under horticulture system	87
6.9.4	Farm mechanization	89

6.9.5	Proposed cropping intensity	91
6.9.6	Animal production system related work (with MGNREGA convergence)	93
6.10	Livelihood activities	95
6.10.1	Non-farm based livelihood activities	95
6.10.2	On-farm based livelihood activities	97
6.11	Soil and water conservation work under NRM	99
6.11.1	Detail dimensions of soil and water conservation works under NRM	99
6.11.2	Cost of Soil and water conservation works under NRM	101
6.12	Gram Panchayat wise proposed EPA activities	103
7	Benefit and cost	
7.1	Net benefit in future	105
7.1.1	Proposed net benefit in future from cropping system	105
7.1.2	Present and future production and value of horticulture system	107
7.1.3	Production and profit from major animal /live stock	110
7.1.4	Net profit of the system through various interventions	112
7.1.5	Gram Panchayat wise cost of project under IWMP	114
7.2	Funds received to Watershed Development Fund (WDF)	116
7.3	Cost : Benefit Analysis (NPV, BC Ratio and IRR)	116
8	Convergence	
8.1	Gram Panchayat wise proposed convergence	117
9	Phasing of the works	
9.1	Physical Phasing	119
9.2	Financial Phasing	122
10	Consolidation and post-project management	
10.1	Activity of consolidation and post project management phase	125
10.2	Adoption of eco-friendly conservation measures	125
10.3	Participation of local community in development and management	125
10.4	Institutionalization for post project management	126
10.4.1	Watershed level committee	126
10.4.2	User Group (UGs) and Self Help Groups (SHGs)	126
	Annexure – I : Computation of profit for various crops based on production cost and production value	127
*Note	<i>Design, Estimate and plan maps are given separately in soft copy to SLNA</i>	

FOREWORD

The declining per capita land and fresh water availability coupled with soil erosion and land degradation in India are posing serious threat to environmental, food, social and economic security. Land and water go together and their development cannot be considered independent of each other for sustainability of rainfed areas. Conservation and management of rainwater holds key for sustainable agriculture in rainfed areas. It has also been amply demonstrated in India and elsewhere that it is impossible to envisage or implement sustainable solutions for land and water resource development and management without active and full participation of local community. Development of land and water together with sustainable production system when confined to small natural drainage unit such as watershed leads to sustainable development. Watershed Management (WSM) has, therefore, emerged as a new paradigm for planning, development and management of land, water and biomass resources with a focus on social and institutional aspects apart from bio-physical aspects following a participatory "bottom-up" approach. A large number of projects for productivity enhancement are being implemented on the watershed approach.

Soil and water conservation including micro-scale water resource development is the foundation of any watershed development programme supported by number of other protection, production and livelihood support interventions. This is so, because water is the most crucial input and acts as a catalyst to bring in ecological, social and economical revolution. Sustainable production depends considerably upon proper development, conservation, management and use of watershed resources at micro-level. Watershed management becomes increasingly important as a system approach to improve livelihood of people while conserving and regenerating their natural resources. The role and Importance of community participation in ensuring the success and satiability of watershed management is now widely accepted.

Two-thirds of the country's agriculture is rainfed. Only one-third of the 142 m ha of cultivated in India is irrigated. The green revolution in the irrigated areas, induced by modern agricultural technologies, by-and large by-passed the rainfed regions. Agriculture in these regions is characterized by low levels of productivity and low input usage; food grain yields in rainfed areas are half those in irrigated regions. Dependence of rainfall makes crop production considerably unstable in rainfed areas, which are home to the bulk of the rural poor. The Government of India has accorded highest priority to the holistic and sustainable development of rainfed areas through the integrated watershed development approach. The key attributes of the watershed approach are conservation of the rain water and optimization of soil and water resources in a sustainable and cost effective mode. Improved moisture management increases the productivity of improved seeds and fertilizers, so conservation and productivity enhancing measures become complementary. Under rainfed conditions choice of technologies are going to vary from location to location due to high degree of complexity and diversity in situations. This applies to the technologies for development of natural resources as well as for enhancement of productivity of different commodities in agriculture and allied sectors. While carrying out participatory planning exercises, the watershed development team (WDT) may orient community members about different scientific and indigenous technological options available with them through IEC and training courses etc. and leave the final choice to them. Keeping these things in mind, the DPR of Pratapgarh IWMP-VI watershed has been prepared.

MESSAGE

Deen Dayal Upadhyaya, State Institute of Rural Development, Uttar Pradesh has been commissioned by State Level Nodal Agency, IWMP to prepare proposed DPRs for 55 identified watershed in the State. Integrated Watershed Management Programme (IWMP); a centrally sponsored programme is aimed towards sustainable regeneration of ecological balance and suitable agricultural and allied production interventions by properly managing and harvesting rain water and thereby increasing production and productivity, providing equitable opportunities and economic upliftment to all section of society in project area. The cost of project is estimated at Rs. 12000.00 per ha. The project will be implemented on watershed basis having an area of about 5000 ha in duration of 5-7 years. There are various components of the project to achieve the set objectives. It is pertinent that a detailed project report (DPR) has been prepared with all the details of plan, design, cost, execution and arrangement for management and evaluation.

Deen Dayal Upadhyaya, State Institute of Rural Development, Uttar Pradesh has prepared this DPR after comprehensive grand study and survey and using available scientific data. I am sure the DPR, if implemented as per the designed interventions, will not only restore ecological balance but will be of immense help for the farmers and agricultural sector to improve their quality of life.

I wish all success to all concern specially those who earn the livelihood from agriculture and allied activities.

Sri. N. S. Ravi (IAS)
Director General

ACKNOWLEDGEMENT

We would first like to extend our thanks to the Chief Executive Officer (CEO) of State Level Nodal Agency (SLNA), IWMP for awarding the assignment of preparation of detailed project report (DPR) of 55 watersheds to DDU SIRD, Lucknow. We extend our heartiest gratitude to Sri N.S. Ravi, I.A.S., Director General, DDU SIRD, Lucknow for assigning the assignment to us and providing all necessary logistic support. We are thankful Sri K. P. Tripathi, former Principal Scientist, Soil & Water Conservation Engg., ICAR-IISWC (formerly known as CSWCRTC), Dehradun for their valuable suggestions and guidance during the process of DPR preparation.

We are very grateful to Dr. Ashok Kumar, Assistant Director, Soil Conservation and Water Management; Sri S. G. Sahoo and Sri R K Srivastav Senior Instructor Agricultural Engineering for helping in the process of DPR preparation. We are thankful to all the farmers of the watershed who cooperated during the PRA/data collection and gave their valuable suggestions.

Dr. Vardani
Additional Director

EXECUTIVE SUMMARY

The Sandwa Chandrika IWMP-VI watershed having a geographical area of 8934.54 hectares is situated in the district of Pratapgarh (UP). It has been designated as IWMP-VI watershed which has eight micro watersheds (code: 2B2F5k2a, 2B2F5i2f, 2B2F6b1b, 2B2F6c1a, 2B2F6c1c, 2B2F6d1d, 2B2F6d1e, 2B2F6d2a). It includes 72 Villages of 45 Villages Panchayats. Only 65% area of the land is under cultivation and 27% land is fallow. The remaining area of about 8% is under small fraction of forest, community land, orchard, habitation and other uses. The topography of the watershed, as a whole, is fairly compact tract of gently undulating land. The elevation varies from about 83 meter (min.) amsl to 98 meter (max.) amsl, with overall gentle slope is from north-west to south-east along Sai river.

The soils are light to medium in texture. Soil of the almost whole watershed is loamy soil, moderately alkaline. Soils of the watershed are deficient in organic matter and soil nutrients. It has high permeability and low compressive strength. *Reh* infestation in the area south of Sai, waterlogging in low lying areas during monsoon and gully erosion in sandy area along Sai river and its tributary water streams etc. are the main natural hazards affecting the upland. Channel Plains of Sai and Loni Rivers and lower elevations of terrace plain are submerged during annual flood. Being flat, gently slopped, maximum area under cultivation, almost 33% of the land comes under Class-I. Rest of the 67% of the area needs a proper planning for soil-water conservation. 25% of total area is under Class III, which is moderately susceptible to salinity issue. Almost 20% of the area is under class VI, which is along the drains and river is susceptible to erosion. The soil erosion in the cultivated land is not a serious problem in the watershed as about 65% of area is subjected to E₁ erosion. The E₂ erosion is observed in about 28% area which is along the streams, whereas 7% area has salinity problem.

Climate of the watershed is warm subtropical with very cold and dry winters from December to Mid February and dry, hot summers from April to Mid June. The rainy season is from mid-June to mid-September when it gets an average rainfall of 618 mm mostly from the south-west monsoon winds. Agro-ecologically, this watershed falls under the “Hot (hyperthermic) moist, semi-arid, Ganga-Yamuna Doab” region and agro-climatic zone is “eastern zone” and both are favorable for agricultural activities. Paddy is the main Kharif crop and Wheat is the main Rabi crop in the district. Other crops grown are mazie, pulses, potato, onion, oilseeds etc. The cropping intensity is 137.75% in the watershed which is little lesser than state’s average. The agriculture productivities are moderate. Aonla is one of the main cash crop and there are number of processing units in Pratapgarh district. The crop productivity is low due to low organic matter in the soil. Chemical fertilizers are given to the crop without soil analysis thus, creating imbalance in the soil nutrients. FYM and organic fertilizer are not in practice due to absence of sufficient raw material.

Sai and the Ganges are the main rivers flowing through Pratapgarh district. During pre-monsoon, the groundwater occurs in 8-15m depth almost in 99% of the area. Post-monsoon, the groundwater level increases almost up to the ground level along the Sai river during rainy season. The groundwater throughout year is maintained to 8-15meter in 99%

area is mainly due to recharge from rivers. The tube-well intensity in the region is 0.2 per hectare and hence irrigation is mostly done using groundwater. As groundwater potential is good in the watershed but increasing overdraft for the irrigation is a growing concern. The increasing soil salinity of the watershed is the major concern

The Socio-economic condition of the people is not very encouraging as 7% of population is below poverty line and 8% population is landless. The total workforce is 35% of the total population, which derives a logical conclusion i.e. 65% of the population, is dependant on the income from rest of the population which is also a partial reason for distressed poverty. 62% of population is directly dependent on the agriculture out of which only 7% are cultivators whereas significantly 55% of total workforce is agriculture laborers. 91% of farmers have land holding less than 1 ha and segmented and scattered agriculture cannot be easily promoted to mechanization. The income level of these small and marginal farmers needs to be enhanced through integrated farming systems, mechanization, allied livelihood avenues, etc. Thrust has to be given to promote integrated crop management in pulses and oilseeds considering their importance in present agriculture. Around 33% of families have a salaried job, which is a reason of withdrawal of interest in agriculture. Total 11% families are women headed, which also bring in distress on the family. Despite moderate literacy rate of 62%, the unemployment is high as current education qualification does not necessarily competent in the market. Almost as many families of the watershed are landless, their livelihood depends upon the occasional employment they get in agriculture sector or they migrate to the nearby city for day to day labor work. Females of the watershed are mostly engaged in Aonla pickle and murabba production, this is a homemade preserves business. The processing of homemade fruit preserves Aonla Based products such as; murabba, candy, jams laddoo, jellies, burfee, aonla juice, pickles, squash etc. for growing the market in this business. This is the major employment of the people of the watershed and also nowadays it has evolved into a business opportunity.

The IWMP plan has been developed comprehensively taking agro-climatic conditions, natural resources, socio-economic conditions, and technology into account, also integrating the opportunities of other livelihood avenues viz. livestock, agro-forestry, horticulture, promotion of Aonla processing etc. Total cost of the project works out to be Rs. 1.12 crores. Out of this Rs. 4.5 crores is proposed to be met from convergence under MGNREGA and Rs. 9.7 lakhs from Horticulture Dept. (NHM) etc. The amount of Rs. 6.53 crores will be met out from IWMP. The benefit: cost ratio is estimated at 1.56:1 with IRR of 20%. About Rs 15 lakhs is expected to be collected from farmers as their contribution for watershed development fund out of which Rs. 5.3 lakhs is for renovation of field bunds and Rs. 9.7 lakhs is for contribution towards NHM programme.

Chapter 1: Introduction and background

1.1 Background of IWMP

National Rainfed Area Authority (NRAA) framed common guidelines (2008) for watershed programmes to all ministries/departments. The provisions in the common guidelines and the observations of the Parthasarthy committee have necessitated modifications in the watershed schemes of the Department of Land Resources. Accordingly, Drought Prone Areas Programme (DPAP), Desert Development Programme (DDP) and Integrated Wastelands Development Programme (IWDP) of the Department of Land Resources have been integrated and consolidated into a single modified programme called Integrated Watershed Management Programme (IWMP). This guideline was further amended in 2011. This consolidation is for optimum use of resources, sustainable outcomes and integrated planning.

The watershed management program in the country has been conceptualized as rainwater management program in the rain fed areas of the country, which constitutes roughly 60% of the total net cultivated land of about 144 mha of the country. It is observed that though the rainfed land is about 60% of the total cultivated land of the country but its contribution to the total food production of the country is less than 40%. As the monsoon in India is unpredictable and drought and floods are observed at peoriodial interval hence, rainwater management is considered as focal point to the solution of the problem of uncertainty of rainfall under rainfed condition. The Indo-Gangetic plain of the country has numerous perennial rivers but still rainfall is the main source of irrigation and domestic need of the people. Presently exploitation of groundwater has been at faster rate thnn its recharge. Therefore rainwater management does not only aims to create surface irrigation potential but also aims to augment groundwater. Under such vision the IWMP has been designed.

State of Uttar Pradesh

Uttar Pradesh is situated in northern part of India. Its geographical area is about 241701 sq km. It accounts for 6.88 percent of total geographical area of the country. The population of the state is about 199.5 million as per census of 2011, which accountes for 16.49 percent of the total population of India. This is most populous state of India and ranks fifth in population. The highest density of population is also found in this region. On account of highest density of population, the per capita availability of land is very low in comparison to other states. The state is divided into 4 divisions, namely Western (30 districts), Eastern (28 districts), Central (10 districts) and Bundelkhand (7 districts). At present state have 75 districts, 327 tehsils, 822 blocks and 107452 revenue villages. The state is also dividend into 9 agro climatic zones, 1.Tarai Region; 2.Western Plain Region; 3.Central Western Region; 4. South Western Region; 5.Central Plain Region; 6.Bundelkhand Region; 7.North Eastern Plain Region; 8.Eastern Plain Region and 9 Vindhya Region. The flood and drought are common phenomena of this region.

The state has more than 32 large and small rivers, of them, the Ganges, Yamuna, Sarayu, Betwa and Ghaghara are larger rivers of the state. Lucknow is the capital of Uttar Pradesh. Agricultural and services industries are most important activities of the state

economy. About 68.54 percent land of the total geographical area of the state is under cultivation (2012-13). The percentage of net area sown in Uttar Pradesh has been decreasing continuously due to fast expansion of industrialization and urbanization in the state.

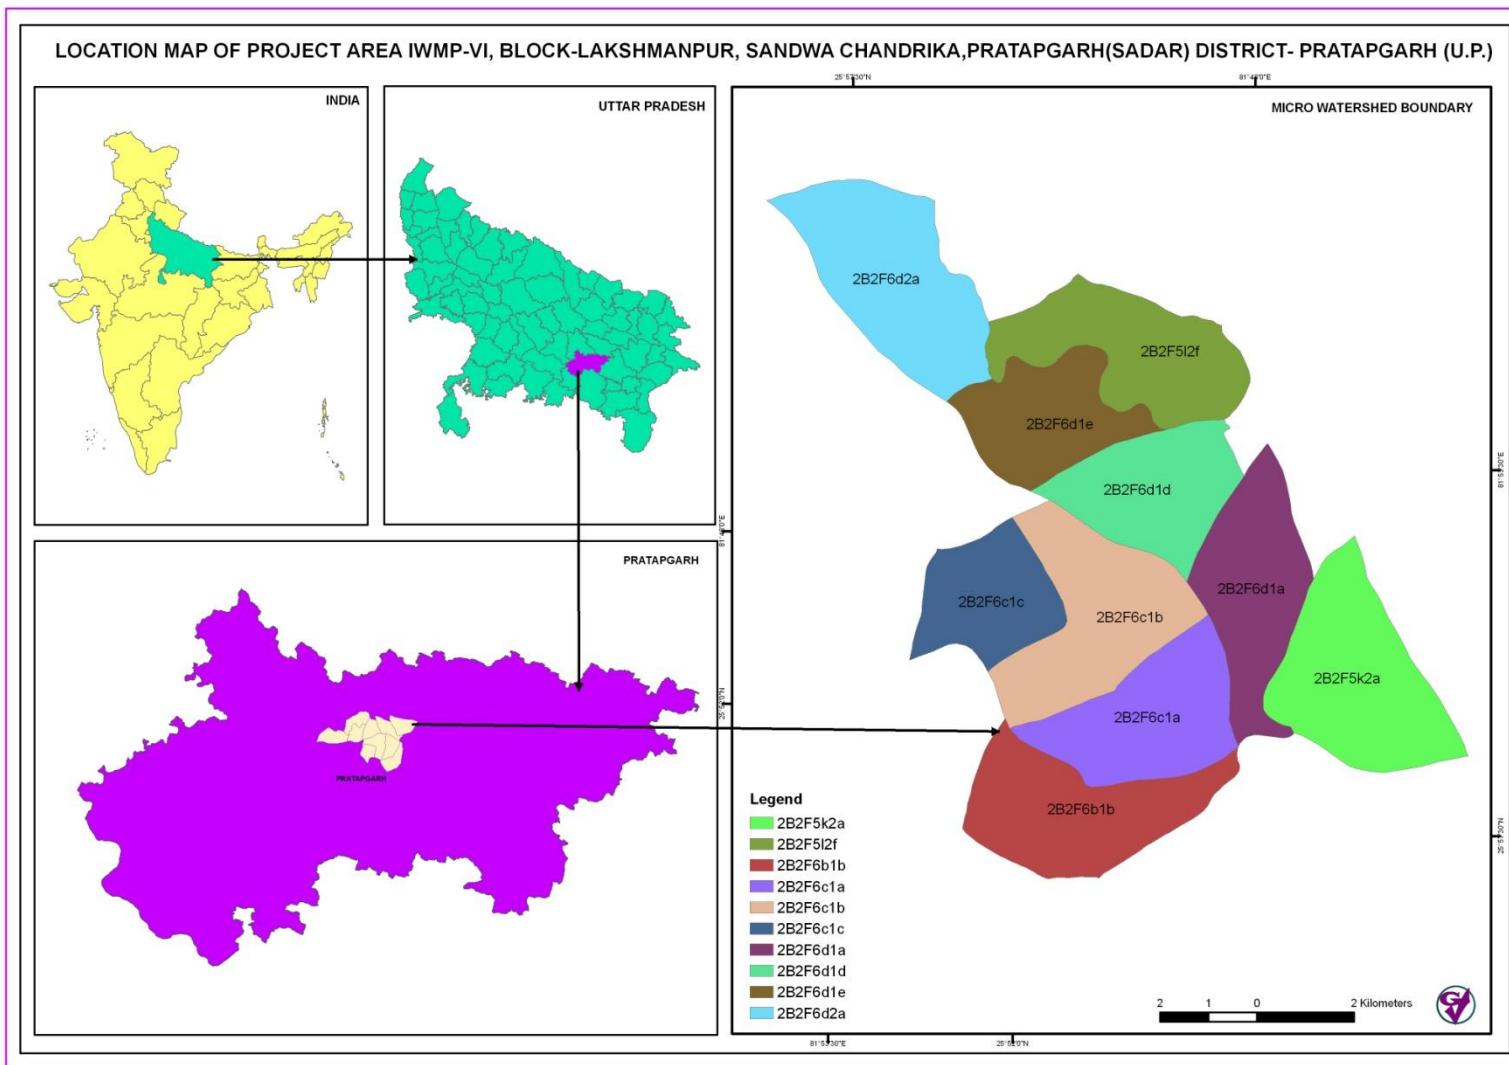

Pratapgarh District

During the 17th century a King Pratap Singh ruled in this area. There he built a fort and called it Pratapgarh after his own name. The district was formed in the year 1858 with its headquarters at Bela derived from the temple of Goddess Bela Bhawani on bank of river Sai. Administratively, district Pratapgarh comes under Allahabad division and it is located 60 Km. from Allahabad and surrounded by district Sultanpur in North, Allahabad & Kaushambi in South, Jaunpur in East and Raibareily & Fatehpur in West. Pratapgarh is primarily, an agrarian district. For a while now, Pratapgarh has risen in ranks as the top producer of Aonla fruit. There are increasing number of Aonla processing units and cottage industries based on Aonla, absorbing large section of unemployed population. The district headquarter, Pratapgarh is on the Allahabad-Faizabad main road, at a distance of 39 km from Sultanpur and 61 Km from Allahabad. It is one of the older districts of Uttar Pradesh.

1.2 Watershed - Sandwa Chandrika IWMP-VI

The Sandwa Chandrika IWMP-VI watershed having an area of 8934.54 ha is situated in the district of Pratapgarh (UP). It has been designated as IWMP-VI watershed which has eight micro watersheds (code: 2B2F5k2a, 2B2F5i2f, 2B2F6b1b, 2B2F6c1a, 2B2F6c1c, 2B2F6d1d, 2B2F6d1e, 2B2F6d2a). It includes 72 Villages of 45 Villages Panchayats. The location of the watershed is depicted in Fig 1.

Fig.1. Location map of Sandwa Chandrika IWMP-VI watershed

Chapter 2: Objectives and Project Implementing Agency (PIA)

2.1 Major objectives

Sl. No.	Objectives
1	The main objectives of the IWMP are to restore the ecological balance by harnessing, conserving and developing degraded natural resources such as soil, vegetation and water.
2	Prevention of soil, run-off; rain water harvesting and recharging of the ground water.
3	Introduction of multi-cropping system and diverse agro-based activities, which helps to provide sustainable livelihood to the people of watershed area.
4	Promote cost effective and proven technologies to support watershed development & management

2.2 Project Implementing Agency (PIA)

Name of the PIA organization	Land Development and Water Resource, Pratapgarh.	
Postal address of the PIA organization	Bhoomi Sanrakshan Adhikari, Land Development and Water Resource, Pratapgarh.	
Name of the head of the PIA organization	Bhoomi Sanrakshan Adhikari, Pratapgarh.	
Name of the Principal Investigator (PI) i.e. Leader of the IWMP project identified by the PIA	Sri. Mukh Ram	
Designation of PI	Bhoomi Sanrakshan Adhikari	
E-mail of the PI	bsaldwrpr-up@nic.in	
Names of the Watershed Development Team (WDT) and contact number	Sl. No	Name and mobile number
	1	Sri. Dheeraj Singh (9554582174)
Names and designation of members of Watershed Cell and Data Centre (WCDC)	2	Sri. Sandeep Chowdhary (7843960008)
	3	Sri. Anuj Kumar (9598469969)
Year of commencement of the project	2012-13	
Year of completion of the project	2017-18	
Budget of the project (in Lakh)	Rs 653.4 lakhs	

Chapter 3: Present scenario of the watershed

3.1 General Profile of the watershed

Sl. No.	Parameter	Information/ value
1	Name of State	Uttar Pradesh
2	Name of District	Pratapgarh
3	Name of the Tehsil	Sandwa Chandrika
4	Name of Block	Sadar, Lachimanpur, Sandwa Chandrika, Lalganj.
5	Name of post office with pincode	Lalganj - 230132
6	Watershed details	IWMP-VI
i.	Name of Watershed	Nevada Kalan, Dandurpuran Singh, Katkavli, Teliyahi, Chaimar Saraiyya, Khargapura, Kataiyya Nevada, Deoli, Sandwa Somwanshi, Sagra Sundarpur.
ii.	Code of Watershed	2B2F5k2a ,2B2F5i2f, 2B2F6b1b, 2B2F6c1a, 2B2F6c1c, 2B2F6d1d, 2B2F6d1e, 2B2F6d2a
Iii	Agro Ecological Region	Hot (hyperthermic) moist, semi-arid, Ganga-Yamuna Doab, Rahilkhand and Avadh plain with LGP 120-150 days
Iv	Agro Climatic Zone	Mid plain zone (central plain zone)
v	Geographical area of the watershed (ha)	8934.54
Vi	Major drainage system	Sai and Loni River
Vii	Stream order of the watershed	up to III rd
Viii	Highest elevation on the topo-sheet (m)	98
IX	Lowest elevation on the topo-sheet (m)	83
x	Elevation difference (m)	15
xi	Length-Width ratio of the watershed	8 : 5
xii	Longitude	81°44'50"E- 81°55'45"E
xiii	Latitude	25°52'15"N- 25°58'00"N
7	No. of Villages in the Project area.	72
8	No. of Villages Panchayats in the Project area.	45
9	Area	-
i	Total geographical area of the watershed (ha)	8934.53
ii	Treatable area (ha)	5445
iii	Arable land (ha)	5814.66
iv	Net Sown area (ha)	4221.20
v	Net Single cropped area (ha)	2600.74
vi	Net Double cropped area (ha)	1620.46
vii	Community land (ha)	28
viii	Social forest/Community forest (ha)	70.52
ix	Area under fruit trees (ha) (Orchard)	29.14
	Area under miscellaneous use (ha)	2992.22
10	Infrastructure/amenities	-
i	Distance of metalled road from village/watershed (km)	0.5-1km
ii	Distance of nearest railway station (km)	8 km
iii	Distance of nearest market (km)	2 km

iv	Distance of Taluka/Tehsil/block (km)	7 km
v	Distance of district headquarter (km)	20 km
11	Education facilities	-
i	Primary School (km)	3 km
ii	Senior school (km)	5 km
iii	College (km)	7km
12	Distance of nearest P.H.C. (km)	3 km
13	Distance of nearest Veterinary Hospital (km)	4 km
14	Distance of nearest post office (km)	3 km
15	Distance of nearest bank (km)	4 km
16	Distance of nearest ration shop (km)	5 lm
17	Distance of nearest police station (km)	3 km
18	Distance of nearest panchayat bhawan (km)	2 km
19	Distance of nearest Community/ recreation centre (km)	3 km
20	Electricity	Average
21	Source of domestic water supply	-
i	Treated water through tap	Yes
ii	Untreated water through tap	No
iii	Shallow dug up well	Yes
iv	Hand pump	Yes
v	Any other (please specify)	No
22	Source of irrigation	-
i	Canal	No
ii	Tube well	Yes
iii	Open well	Yes
iv	Open dug up ponds	Yes
v	Any other (please specify)	River
23	Types of cattle	-
i	Buffalo	Yes
ii	Bullock	Yes
iii	Cows	Yes
iv	Goats	Yes
v	Sheep	No
vi	Pig	Yes
vii	Horse	No
viii	Poultry	Yes
24	Source of water for cattle	-
i	Hand pump through manger	No
ii	Open well through manger	Yes
iii	Open dug up pond	Yes
iii	Any other (please specify)	River

3.2 Village wise landuse of the watershed

Sl. No	Villages			Micro-Watershed			Area details

3.3 Watershed maps

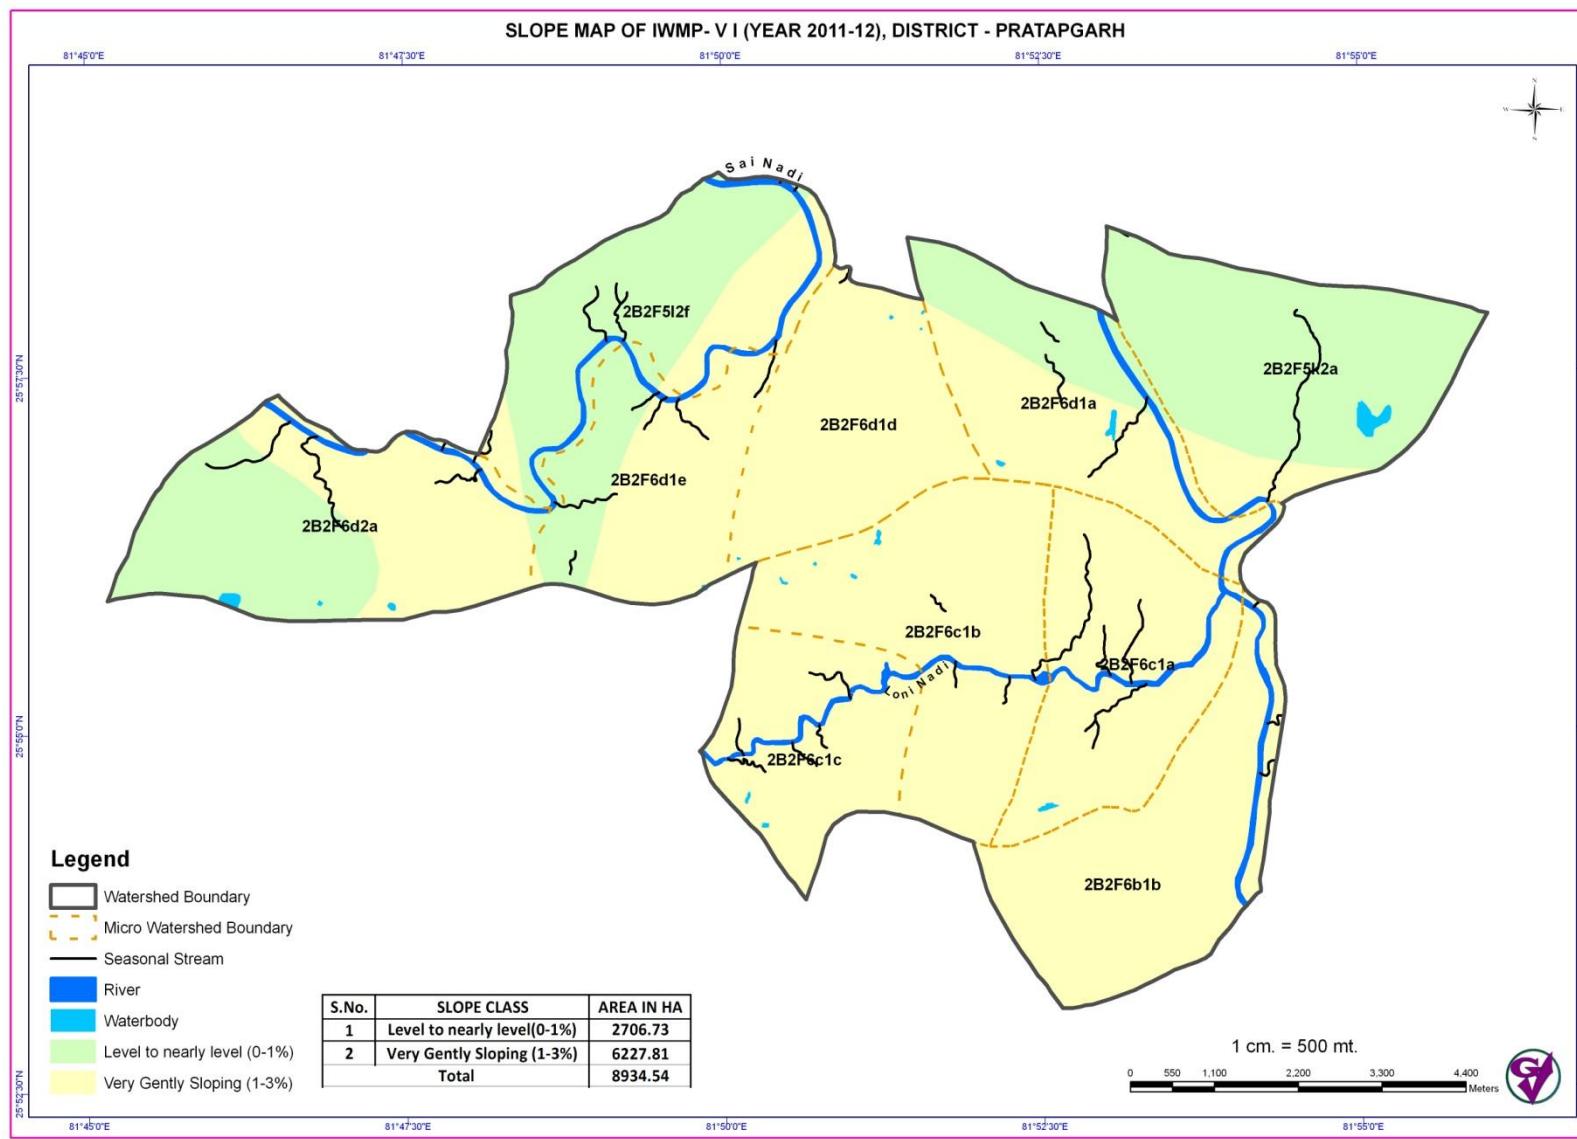

Various watershed maps viz. base map, slope map, drainage map, land capability class map, land use map etc required for planning of suitable soil and water conservation measures are given below:

3.3.1 Base Map

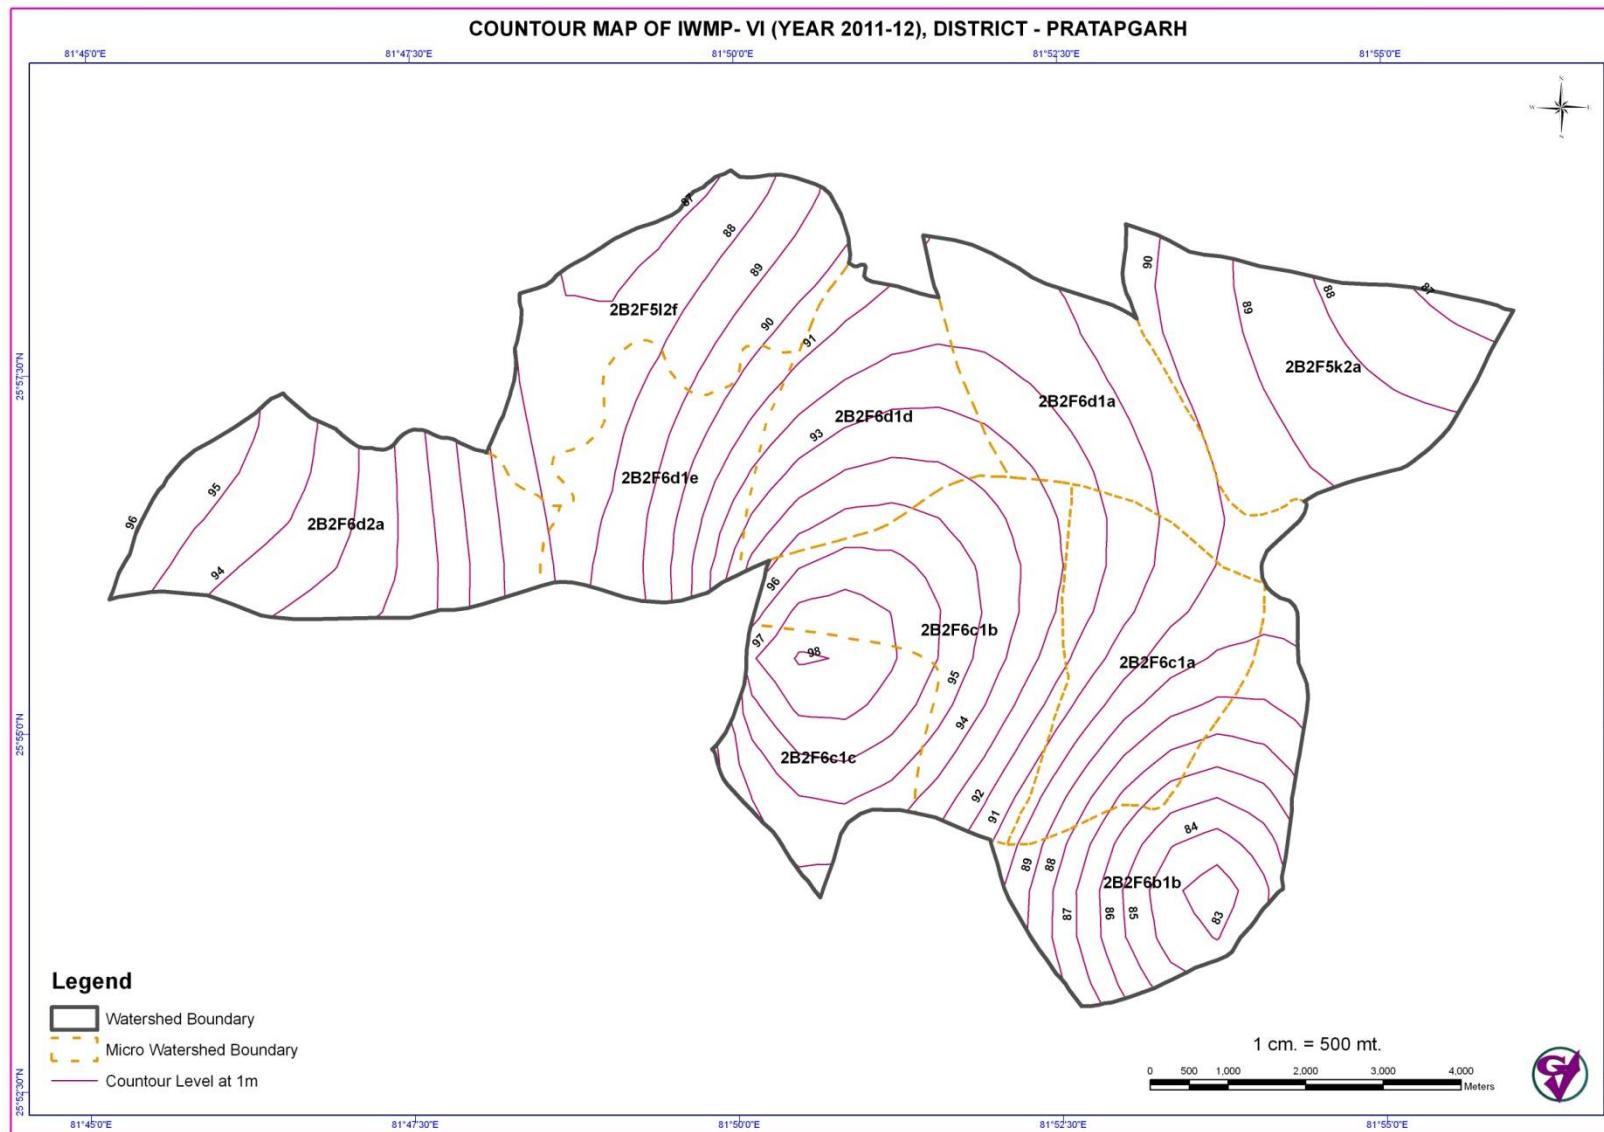

The Base map of Sandwa Chandrika IWMP-VI watershed is given below:

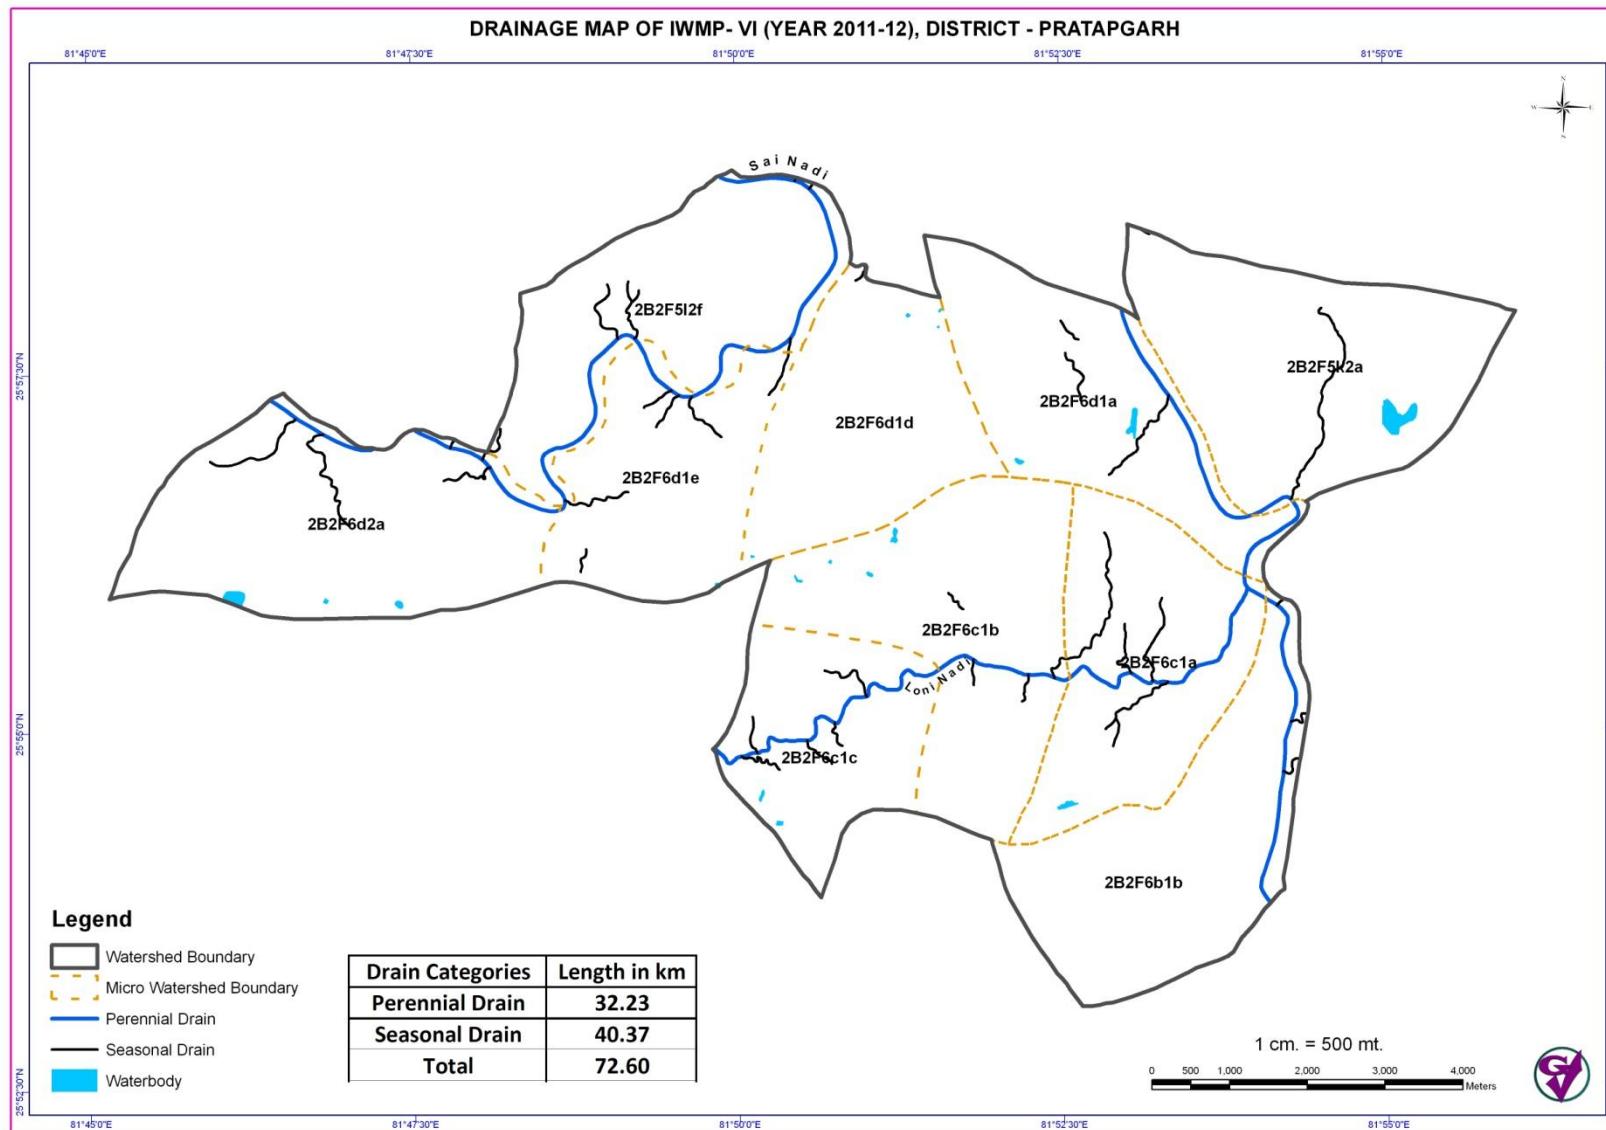

3.3.2 Slope Map: The slope map of the watershed is given below. It is observed that general land slope of the watershed is 1-3%.

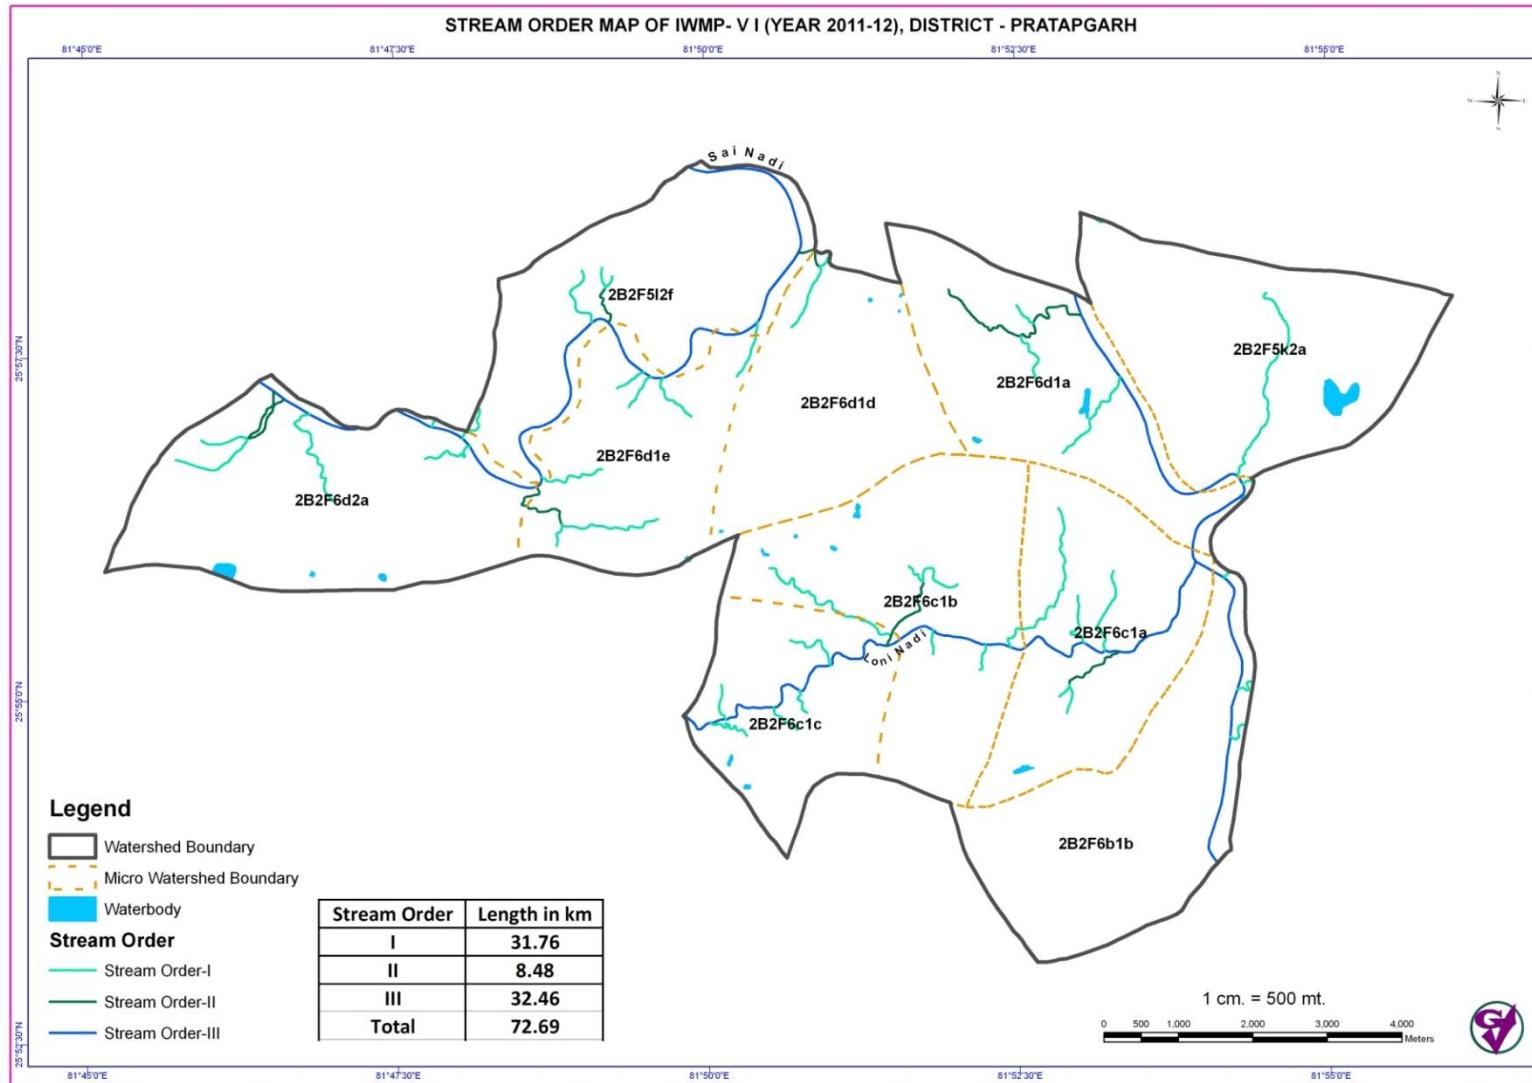

3.3.3 Contour Map: The lowest elevation of the watershed is 83 m amsl and the highest elevation is 98 m amsl.

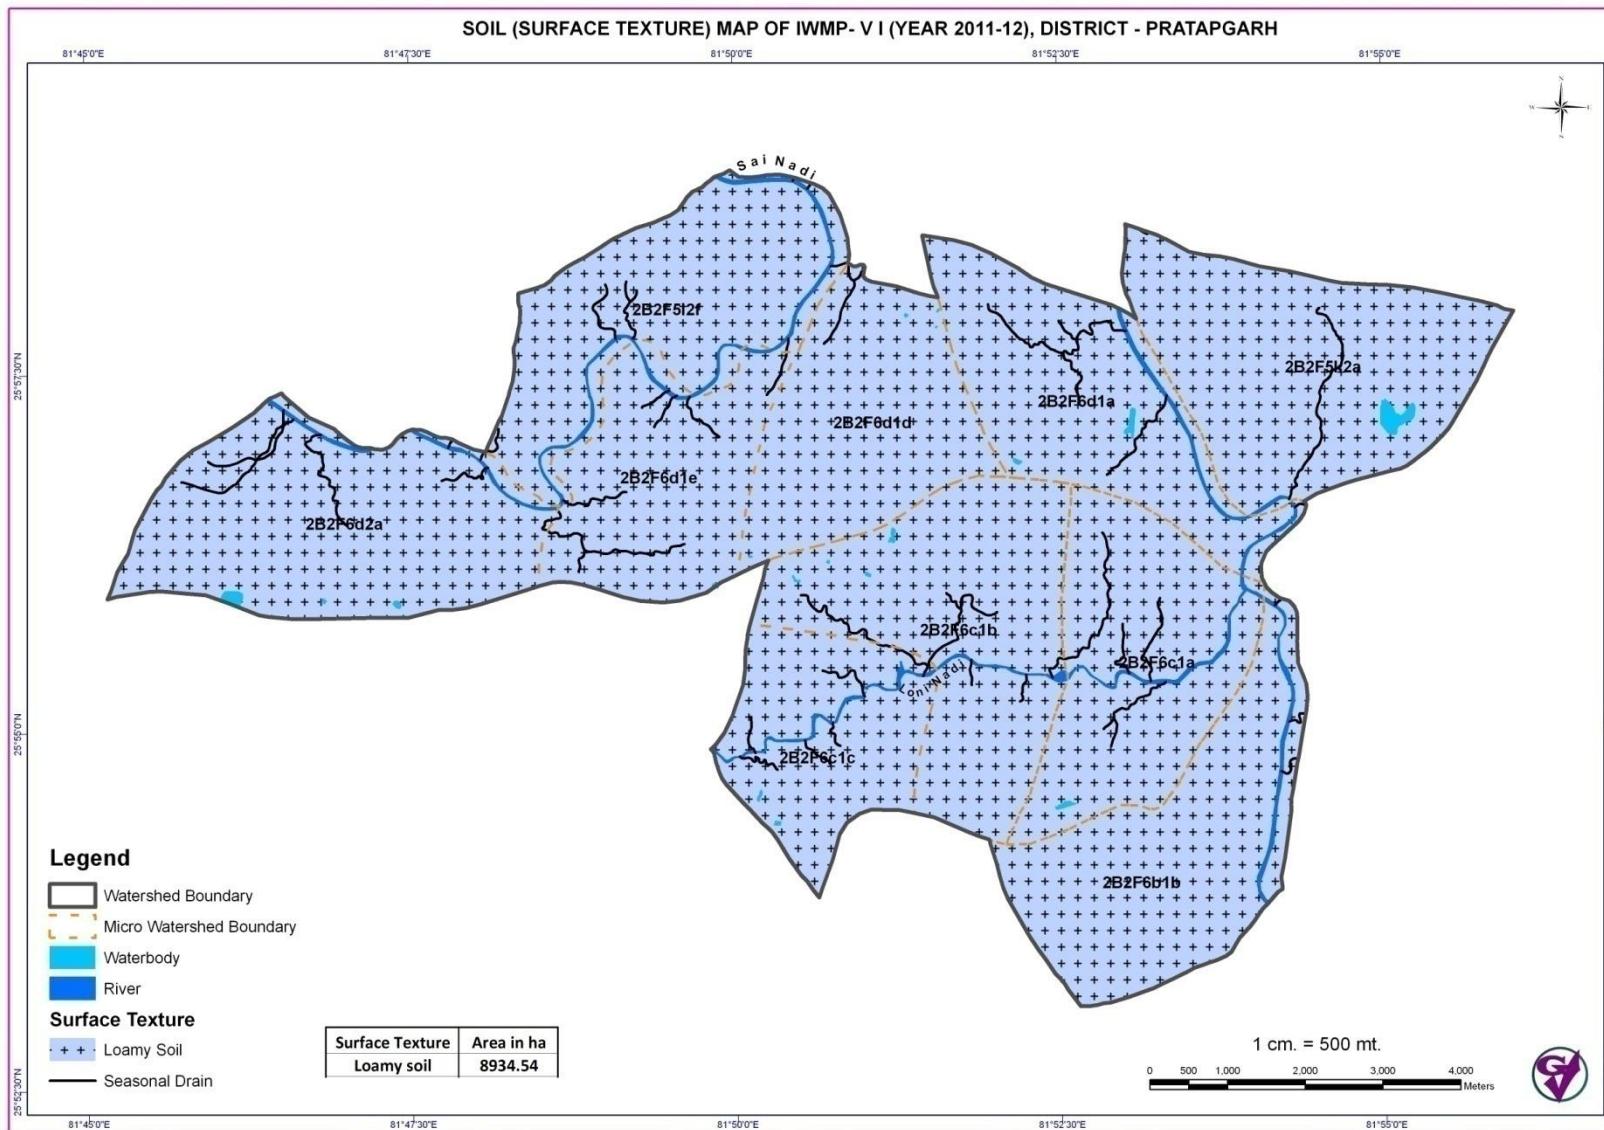

3.3.4 Drainage Map: Seasonality: The total length of seasonal stream is 40.37 km whereas perennial stream is 32.23km.

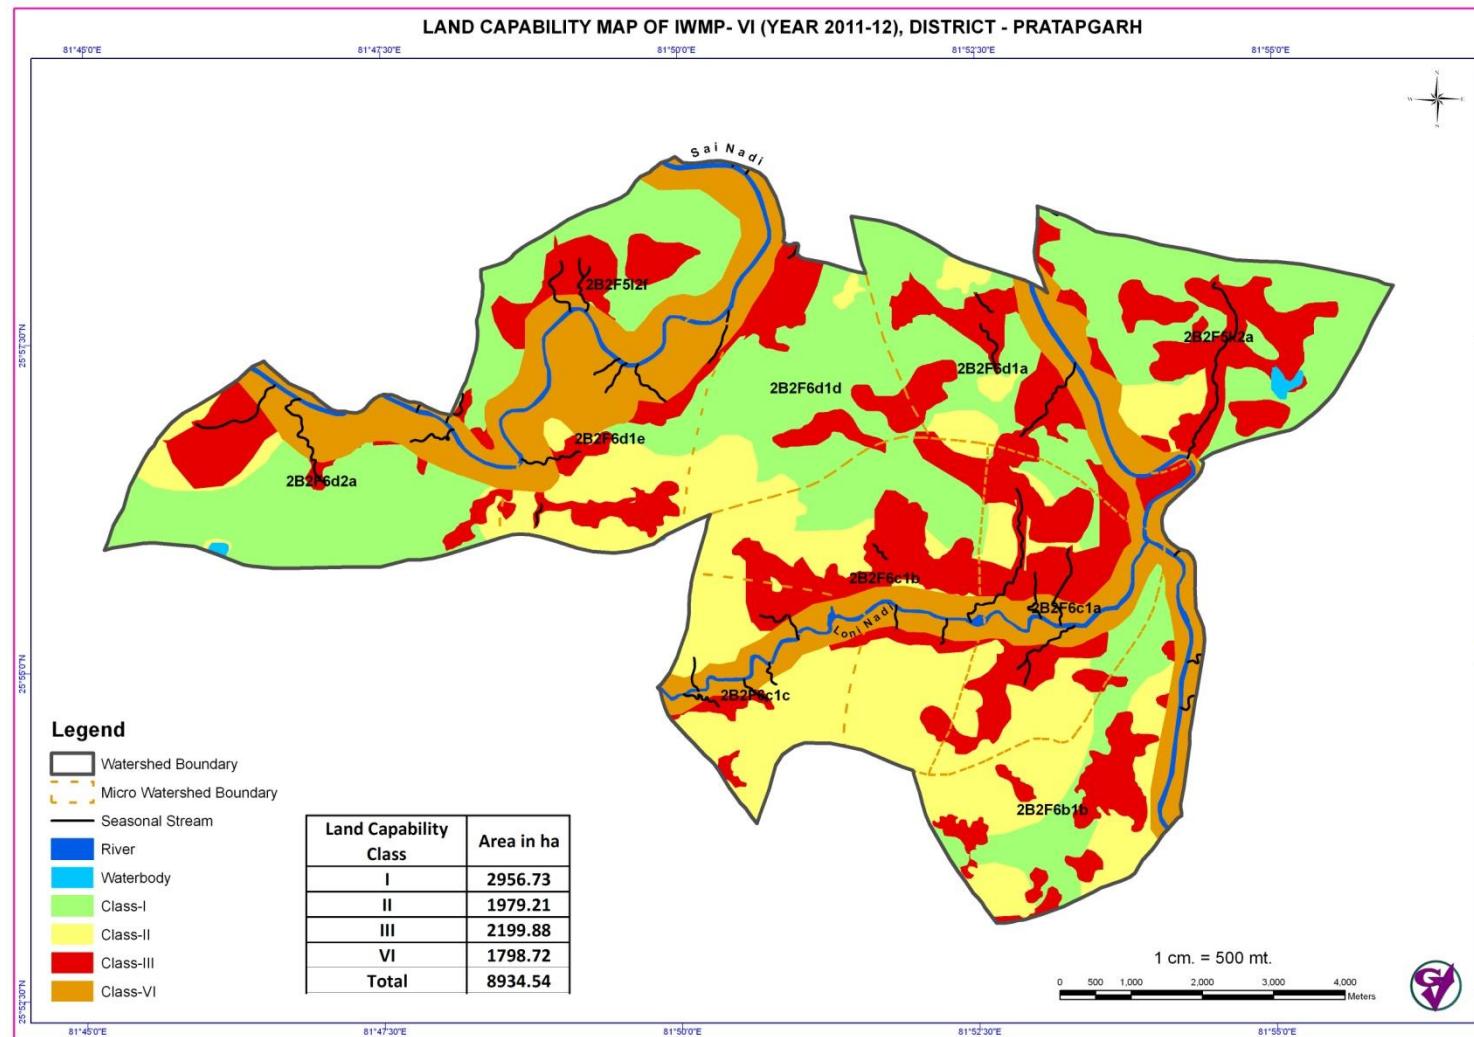

3.3.5 Stream order map: The Sandwa Chandrika watershed is IIIrd order stream watershed. The stream order map of the watershed is given below:

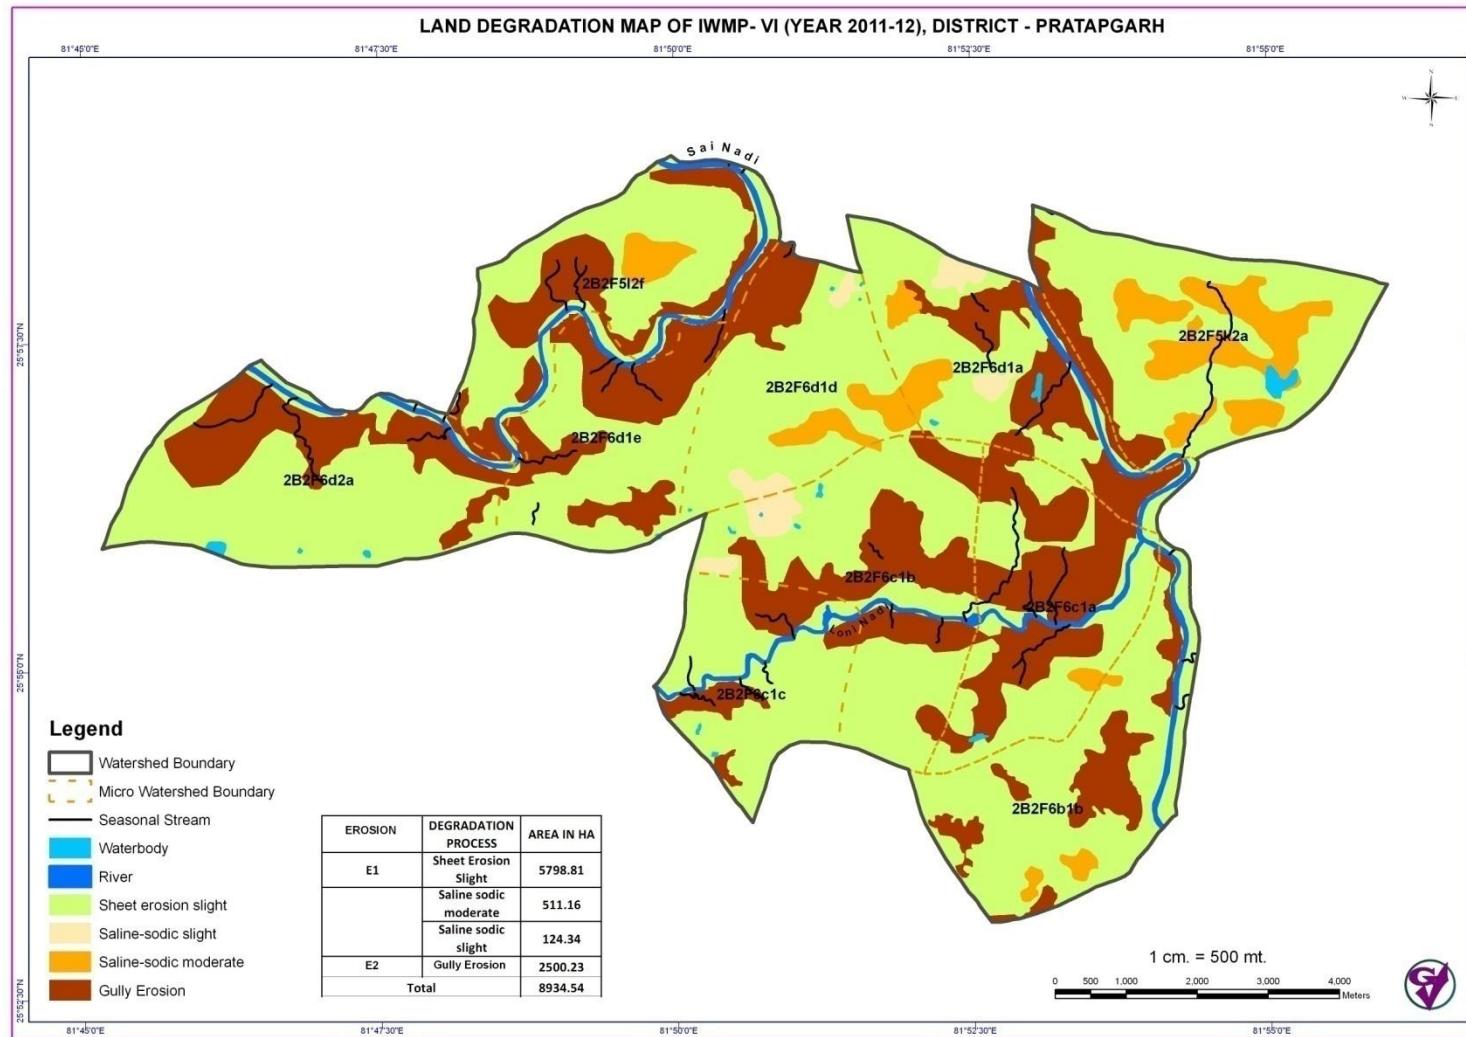

3.3.6 Soil map: The soil map is given below. The soils are light to medium in texture. Soils of the watershed are loamy soil.

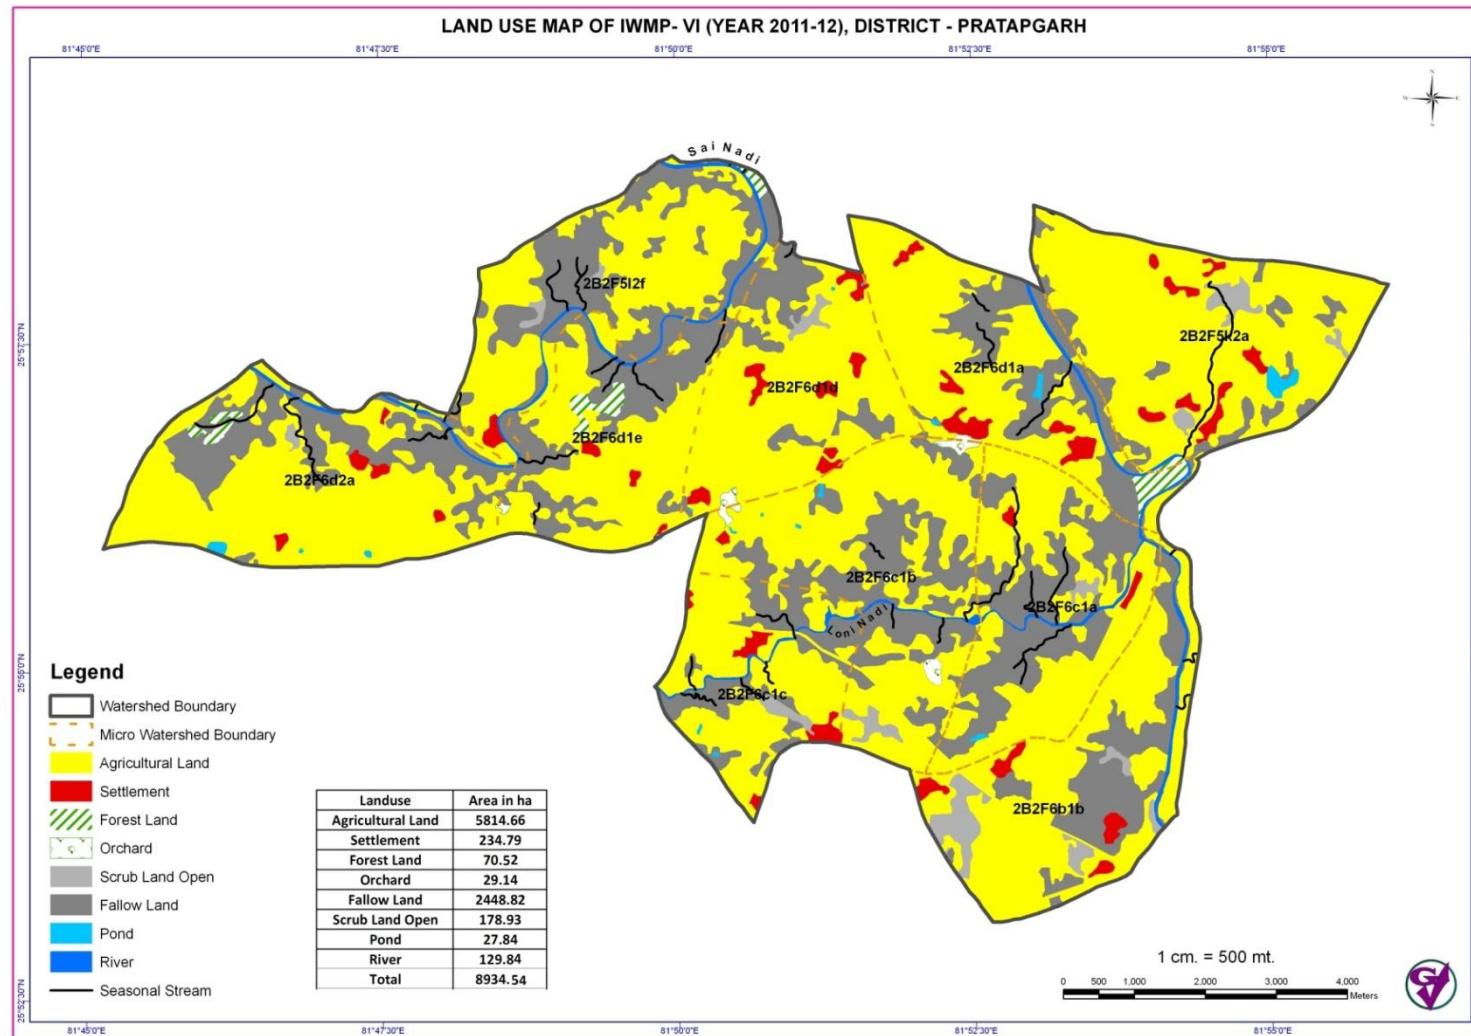

3.3.7 Land Capability Class: Being flat, gently sloped, maximum area under cultivation, almost 33% of the land comes under Class-I. Rest of the 67% of the area needs a proper planning for soil-water conservation. 25% of total area is under Class III, which is moderately susceptible to salinity issue. Almost 20% of the area is under class VI, which is along the drains and river is susceptible to erosion.

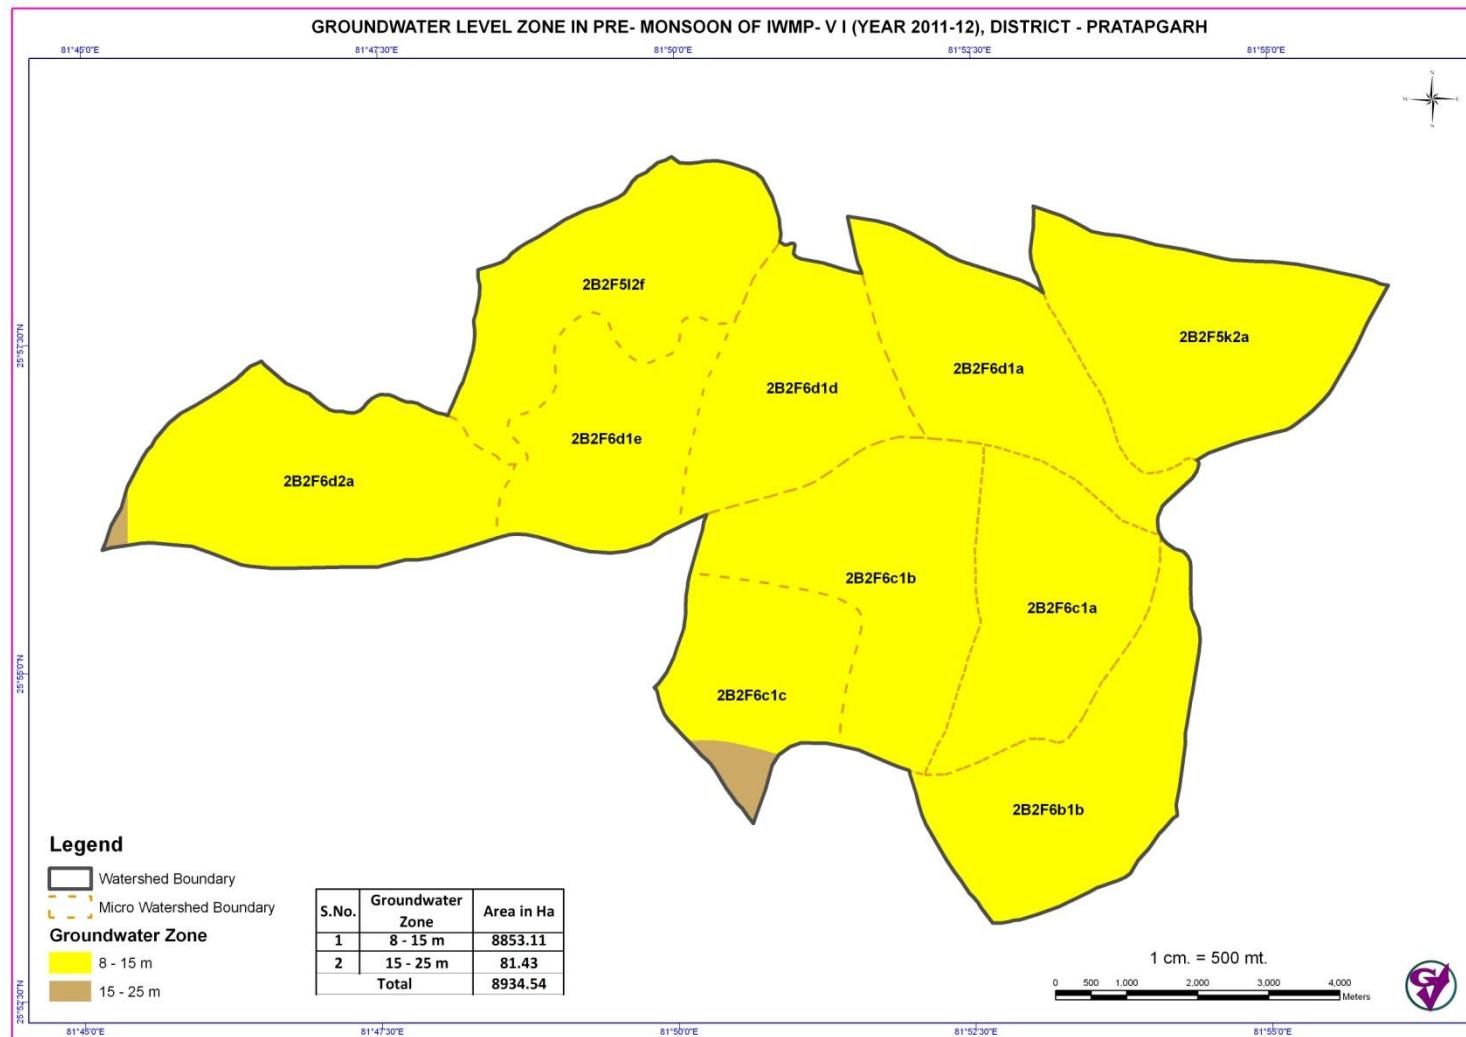

3.3.8 Land degradation: The soil erosion in the cultivated land is not a serious problem in the watershed as about 65% of area is subjected to E₁ erosion. The E₂ erosion is observed in about 28% area which is along the streams, whereas 7% area has salinity problem.

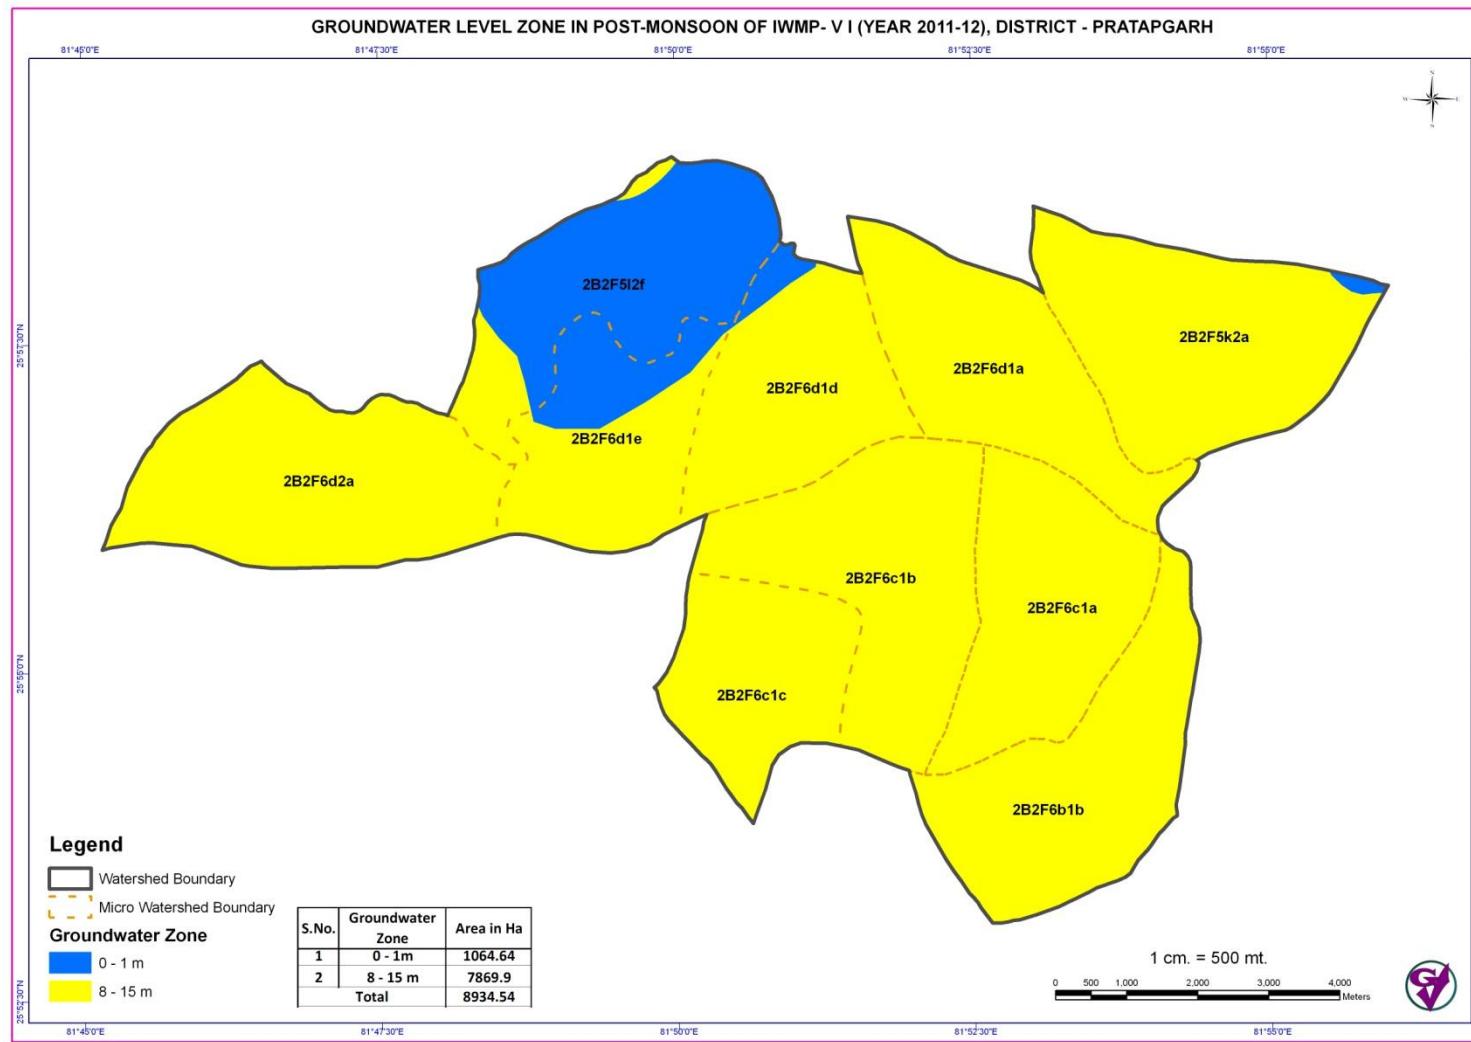

3.3.9 Landuse: The total area of the watershed is 8934.54 ha. Only 65% area of the land is under cultivation and 27% land is fallow. The remaining area of about 8% is under small fraction of forest, community land, orchard, habitation and other uses. The land use map is given below:

3.3.10 Ground water level map: The pre and post monsoon ground water maps are given below. During pre-monsoon, the groundwater occurs in 8-15m depth almost in 99% of the area. Post-monsoon, the groundwater level increases almost upto the ground level along the Sai river during rainy season. The groundwater throughout year is maintained to 8-15meter in 99% area is mainly due to recharge from rivers.

3.4 Climate

Climate of the watershed semiarid climate with very cold and dry winters from December to Mid February and dry, hot summers from April to Mid June. The rainy season is from mid-June to mid-October when it gets an average rainfall of 788 mm mostly from the south-west monsoon winds. It can be observed from the annual mean of the last century (19001-2002) that average rainfall has decreased with increasing variability across years. The average rainfall has varied between 562 to 1269mm in last ten years, and such variations are not conducive for the agriculture. The mean maximum temperature is 33°C, whereas minimum temperature is 20°C. During winter, temperature drops down to 8-9 °C, but in some extreme events it has gone below 4°C. Fog is quite common from late December to late January. Relative humidity varies between 85 to 20% across an year. Summers can be hot with temperatures rising upto 41°C with lowest relative humidity of 20%.

Total					86	NA	NA

3.6 Physiography and Soils

Physiographically, the watershed falls under the Gangetic alluvial plains¹, which is characterized by an almost imperceptible change in elevation and uniform riverain material. Watershed as a whole is fairly compact tract of gently undulating land. Alluvium, the only geotechnical province, has high permeability and low compressive strength. The soils are light to medium in texture. Soil of the almost whole watershed is loamy soil, moderately alkaline in some patches. Soils of the watershed are deficient in organic matter and soil nutrients. It has high permeability and low compressive strength. *Reh* infestation in the area south of Sai, waterlogging in low lying areas during monsoon and gully erosion in sandy area

¹ Proceedings of the constraints and priorities for research and development in Agriculture and allied sectors of Uttar Pradesh, U.P. council of Agriculture Research, Lucknow, U.P. India 2002.

along Sai river and its tributary water streams etc. are the main natural hazards affecting the upland. Channel Plains of Sai and Loni Rivers and lower elevations of terrace plain are submerged during annual flood. Deposits of silt and clay, located mainly on alluvium are exploited for making bricks. Sand deposits are few and are associated with Channel Plain of Sai River. Light brown sandy to loam soil, found near drainages, generally poor in water holding capacity but has high permeability. Hence these areas are good for recharge structures. Also such soil is low organic matter, moderately alkaline.

Sl. No	Name of Microwatershed	Area (ha)	Soil depth	Saline/ Alkaline	Fertility	Status of macro nutrients	Status of micro nutrient
1	2	3	4	5	6	7	8
1	Nevada Kalan (2B2F5k2a)	1085.36	>100 cm	Moderate to severe	Medium	Organic Carbon and Nitrogen Deficient	Zn Deficient

3.7 Hydro-logy

Sai and Ganges are the main rivers flowing through Pratapgarh district. In the south-west the Ganges forms the boundary of the district for about 50 kilometres (31 mi). Separating it from Fatehpur and Allahabad and in the extreme north-east the Gomti forms the boundary.

Sl. No.	Name of water source	Capacity/number
1	Canal	Not Available
a	Type	Not Available
b	Discharge (cubic meter per second)	Not Available
c	Flow months	Not Available
d	Maintenance	Not Available
2	Open dug up well	-
a	Average water table (m)	8-15 m
b	Total number	78
c	Number of functioning wells	65
d	Number of defunct wells	13
e	Diameter of the well (give range), m	3-4
f	Number of lined wells	45
g	Number of unlined wells	33
h	Whether well has parapet wall	some have
i	Whether used for ground water recharge	No
j	Main purpose	-
i	Drinking water	✓
ii	Irrigation	✓
iii	For cattle	✓
3	Tube well	
i	Number of tube wells installed	1520
ii	Number of functional tube wells	1475
iii	Number of defunct tube wells	45
iv	Average depth (give range), m	42 m
v	Diameter (give range), cm	10 cm
vi	Average discharge (cubic meter per second)	NA
vii	Average working hours per year (hrs)	Approx. 385 hrs (Depends on Rainfall & Electricity)
4	Open dug up ponds	-
i	Number of open dug up ponds	94
ii	Number of ponds used for irrigation	22
iii	Average depth of open dug up ponds (give range also), m	2
iv	Average size (give range), ha	0.25

3.8 Human population

Total population is 111,639. Out of these, 18.6% population belongs to schedule caste and schedule tribe collectively. The gender ratio is 1035:1000 in SC communities whereas 1002:1000 in general categories, which are still better than national average and state average. The overall gender ratio is 1009:1000. Village wise population is given below:

Sr. No .	Name of Villages	Name of Gram Panchayat	Male			Female			Total			Total Population
			SC	ST	General	SC	ST	General	SC	ST	General

3.10 Socio-economic aspects

The Socio-economic condition of the people is not very encouraging as 7% of population is below poverty line and 8% population is landless. The total workforce is 35% of the total population, which derives a logical conclusion i.e. 65% of the population, is dependant on the income from rest of the population which is also a partial reason for distressed poverty. 62% of population is directly dependent on the agriculture out of which only 7% are cultivators whereas significantly 55% of total workforce is agriculture laborers. 91% of farmers have land holding less than 1 ha and segmented and scattered agriculture cannot be easily promoted to mechanization. The income level of these small and marginal farmers needs to be enhanced through integrated farming systems, mechanization, allied livelihood avenues, etc. Thrust has to be given to promote integrated crop management in pulses and oilseeds considering their importance in present agriculture. Around 33% of

families have a salaried job, which is a reason of withdrawal of interest in agriculture. Total 11% families are women headed, which also bring in distress on the family. Despite moderate literacy rate of 62%, the unemployment is high as current education qualification does not necessarily competent in the market. Hence vocational training, higher education facilities are also required. Almost As many families of the watershed are landless, their livelihood depends upon the occasional employment they get in agriculture sector or they migrate to the nearby city for day to day labour work. The livelihood avenues for landless people like small scale enterprises (PPP model), vocational training on other skillset like plumbing, masonry, etc. should be imparted.

3.11 Details of farming community, land less families and families below poverty line

About 8% families of the watershed are land less and about 7% families are below below poverty line. Gram Panchayat wise details are given below:

3.19 PRA (Participatory Rural Appraisal)

Participatory rural appraisal (PRA) is an approach used by people to gather information on various aspects from the community in an organized manner without the use of any structured questionnaire. The approach aims to incorporate the knowledge and opinions of rural people in the planning and management of development of projects and programmes.

3.20 List of agencies/projects/schemes presently working in the watershed

The information is given in following table. There are about 5 agencies undertaking welfare activity in watershed.

Agencies/projects/schemes presently working in the watershed			
Sl. No.	Name of the agencies/projects/ schemes	Sponsoring Agency	Main activity
1	MGNREGA	MORD	Rojgar Scheme
2	ATMA(agriculture)	MOA(agriculture)	Crop Production, Tool Implement Distribution
3	Horticulture Mission	MOA(agriculture)	Floriculture ,Vegetable and

			Plantation
4	SGSY /NRLM	MoRD	Self Employment

3.21 People institution

3.21.1 Details of list of SHGs formed

The village wise details of SHG formed in the watershed are not available.

3.22 List of UGs formed

The village wise details of UG formed in the watershed are not available.

3.23 List of members of the Watershed Committee (WC)

The details of member of watershed committee are given below.

Micro-watershed	Name of the member	Micro-watershed	Name of the member

Chapter 4: The problems and need of the area

4.1 Crop productivity/soil and land degradation, soil and water conservation problems

At present, the condition of the life of the people living in villages is gloomy. The population of watershed is ever rising. The abnormal rise in population has intensified the problem of unemployment in watershed. The problems of the villagers are many and varied. A lower productivity of main crops in most areas of the watershed, lack of diversification in agriculture from low value to high value crops, inadequate and inefficient infrastructure for development in rural areas and lesser employment generation in the other more remunerative sectors of the economy. So, the people of the watershed have chosen the alternate source of income, in production of Aonla made products. Recently, the benefits of Aonla, a versatile fruit, have been discovered which has medicinal properties and its export is helping Pratapgarh flourish in its economy. The District should become self-sufficient in their economy and the villagers would not run to the cities in search of jobs. This would ensure that the large-cities are not overcrowded with huge population. It would help maintain the balance between the job/vacancy and the job seekers.

There are several other factors, which require immediate consideration such as the consistent increases in the number and area of uneconomic and non-viable agricultural operational holdings, inadequate and inefficient irrigation network, inadequate development of rural infrastructure, more particularly of roads and lack of proper and adequate marketing and storage facilities with little contribution from agro-processing units. There is no perceptible impact on employment; only during road construction period some additional employment was generated. However, increase in employment opportunity outside villages has increased because of accessibility and connectivity. People have reported that they find it easier to travel seeking work and there is greater job continuity.

The total workforce is 35% of the total population, which derives a logical conclusion i.e. 65% of the population, is dependant on the income from rest of the population. About 62% people in the watershed are literate. In comparison, females are less educated than males. Despite moderate literacy rate of 62%, the unemployment is high as current education qualification does not necessarily competent in the market. Mass education should be spread by establishing more primary and secondary schools. It must be made both compulsory and free for the females and the males as well, so to improve the educational level. The economic condition of the people is not very encouraging as 7% families belong the BPL class, 8% of families of the watershed are landless, 19% of families belong to SC category and 91% families are marginal famers. The livelihood of the landless mainly depends upon the occasional employment they get in agriculture sector or they migrate to the nearby city for day to day labour work. The family size in the villages ranged from six to eight with at least four children in most of the households. This holds true for all castes and religions. The high population growth rate has translated into a high rate of unemployment. The family planning programmes implemented through the public health centers (PHCs) and serviced by the ANMs are reported to be working well. However, these services need to be improved.

Females of the watershed are mostly engaged in Aonla pickle and murabba production, this is a homemade preserves business. The processing of homemade fruit preserves are the jams, murabba, jellies, pickles etc. for growing the market in this business. Males keep themselves busy in marketing of these products. This is the major employment of the people of the watershed. Pickling had its roots as a preservation technique, especially for sailors, but nowadays it has evolved into a business opportunity. Many people particularly enjoy the taste and flavors of pickled vegetable; hence it has risen in demand. There are a

variety of vegetables that you can gather for pickling. Like in the watershed there is a growth of Aonla and Mango, which are very famous pickles of Uttar Pradesh region. The status of women in general is appalling in the watershed. They are the largest labour force inside and outside the family.

The watershed has average water table of 8-15 m. During pre-monsoon, the groundwater occurs in 8-15m depth almost in 99% of the area. Post-monsoon, the groundwater level increases almost upto the ground level along the Sai river during rainy season. The groundwater throughout year is maintained to 8-15meter in 99% area is mainly due to recharge from rivers. There are about 78 wells in the watershed, 65 are functional and about 10 are no longer functioning in the watershed. The tubewell intensity in the region is 0.2 per hectare and hence irrigation is mostly done using groundwater. As groundwater potential is good in the watershed but increasing overdraft for the irrigation is a growing concern. The increasing soil salinity of the watershed is the major concern as 7-8% of the area is affected due to salinity. Being flat, gently slopped, maximum area under cultivation, almost 33% of the land comes under Class-I. Rest of the 67% of the area needs a proper planning for soil-water conservation. 25% of total area is under Class III, which is moderately susceptible to salinity issue. Almost 20% of the area is under class VI, which is along the drains and river is susceptible to erosion. About 65% of area is subjected to E₁ erosion, whereas the E₂ erosion is observed in about 28% area which is along the streams. In this regard, the proper soil-water conservation measures are necessary to stop soil erosion.

The overall infrastructure needs to improved and also the accessibility to the infrastructure and facilities. Every Watershed should have a hospital or a primary health centre for providing medical aids to the villagers. Rural banking should be set up for financial assistance to the village people. A good network of roads is the first and foremost requirement for development. It not only makes it easier to transport goods and services but also saves on time as well as costs. Moreover, it facilitates the flow of information and knowledge. The construction of rural roads and programmes of village connectivity have received considerable attention in the past few years in the state. There is need to develop agricultural facilities like cold-storages, *Krishi Upaj Mandi*, and post harvesting processing units. So that it can provide access to villagers in post-harvest storage, marketing accessibility and also processing will be value-addition for better economic returns.

4.2 Socio-economical problems and gaps

Economic growth, sustainable use of natural resources and environmental security were identified as the major issues to be addressed in the watershed area. People in the villages depend mostly on agriculture and it is vulnerable to climate change. After months of hard work, when the crop is ready to be harvested, untimely rains just damage the yield which leads to huge losses. Agriculture being a labour intensive job, people spends so much of time in the fields yet it ends up giving negligible returns at times. A proper compensation mechanism need to be established and delivered in case such climatic events. The villages needs to have co-operative societies and government assistance to regulate buying and selling of agricultural produce. Most of the farmers go to the nearby town to sell their products at throw away prices and later small shops from this village buy it from those traders, who sell it at much higher prices. So ironically people in the village end up paying more for their own produce. So it is becoming very important to find an alternate and steady income. The post-harvesting processing of Aonla, and Mango, can be a major employment opportunity for the people of the watershed.

Watershed should have accessibility to health facilities, also veterinary services for the animals. The quality of education should be improved. The current education system is not upto the level. Also a skill development programmes should be implemented in accord with need of the area. Government should encourage and develop the agriculture based industries in district so that the rural people don't migrate to the urban areas. More employment should be generated in district for the seasonal unemployment people. Rapid Industrialization should be created. Development of the district will stop the migration of the rural people to the nearby districts like Lucknow and Allahabad and this will not put more pressure on the urban city jobs. A good network of roads is the first and foremost requirement for development. It not only makes it easier to transport goods and services but also saves on time as well as costs. Moreover, it facilitates the flow of information and knowledge. The construction of rural roads and programmes of village connectivity have received considerable attention in the past few years in the state. Rural banking should be set up for financial assistance to the village people. Drinking water to the SC people is also a problem therefore hand pump needs to be installed in the area through other state/central govt. programmes under convergence. All the drains in the watershed need de-silting and cleaning so as to drain the run-off water efficiently to the Sai River. Few troughs also need to be constructed near a water source to provide fresh water to the animals.

4.2.1 Details of SWOT Analysis

Details of Strength, Weakness, Opportunities and Threats (SWOT) are given below.

Parameter	Strengths	Weaknesses	Opportunities	Threats
Community	<ul style="list-style-type: none"> 1. Women's active involvement in farm related activities, and in Aonla production. 2. Household is significant feature and women are involved in most of the operation in agriculture including subsidiary enterprises like dairy and poultry etc. 3. Most of the women farmers irrespective of their category are hard working in the farm activities and have excellent knowledge of making pickles. 	<ul style="list-style-type: none"> 1. Increasing effect of urbanization on rural youth, driving them away from agriculture 2. Lack exposure of knowledge of banking and credit cooperatives. 3. Women do not have much say on policy issues of the activities. 4. Limitation of technically trained female extension workers. 5. Female workers do not impart knowledge on household activities, child care, nutrition etc. 6. Unequal wages between male and female workers. 7. Role of women in the watershed programme is not specified. 	<ul style="list-style-type: none"> 1. Skill development for the rural youth. 2. Increasing urbanization has to be seen as new market potential. 3. Making of self help groups with small savings and provision of loans by revolving fund on small enterprises related to the agriculture. 4. Awareness among the women to improve their skill and knowledge of micro-watershed based development programme. 5. Watershed development team has technical women to train women of watershed and availability of some voluntary organizations for the purpose. 6. Women's potential and capabilities have not been exploited due to lack of specific growth opportunities 	<ul style="list-style-type: none"> 1. Ill-effect of urbanization 2. Change in social functioning and relationship. 3. Male farmers may not provide opportunities to farm women for more rights.
Physical infrastructure	<ul style="list-style-type: none"> 1. Good network of road 2. Electrified villages 3. Availability of Primary and Secondary School building 	<ul style="list-style-type: none"> 1. Lack of sufficient road side plantation. 2. Insufficient electricity supply hampering irrigation schedules. 3. 	<ul style="list-style-type: none"> 1. Regularizing electricity supply 	<ul style="list-style-type: none"> 1. Lack of maintenance and accessibility

Parameter	Strengths	Weaknesses	Opportunities	Threats
Facility	<ul style="list-style-type: none"> 1. Availability of school, Angan Wadi Centres (AWC), hospital and drinking water. 2. Fair educational status of the villagers 	<ul style="list-style-type: none"> 1. Poor animal health facilities. 2. Poor agriculture storage and market facilities 	<ul style="list-style-type: none"> 1. Market opportunity in nearby districts. 2. Creation of cold-storages, post-harvesting processing etc. 	<ul style="list-style-type: none"> 1. Lack of maintenance
Technology	<ul style="list-style-type: none"> 1. Farmers know the concept of cash crops 2. Villagers know the importance of natural resource 3. Project area has number of institutions under Central/ State Govt. viz. ICAR, CSIR, SIRD, SAU's Agriculture college, and Technical university etc to backup the development programmes. 	<ul style="list-style-type: none"> 1. No significant efforts have been made to generate women specific and women friendly farm technologies. 2. Gap in technology dissemination 3. Technical knowhow is low. 4. Communication gap. 5. Lack of technical personnel at block /grass root level. 	<ul style="list-style-type: none"> 1. Great desire for the use of modern techniques in agriculture. 2. Scope of new cropping pattern and irrigation methods/ soil improvement /development of cash crops and horticulture. 3. Conservation and utilization of natural resources (with particular reference to water and forest). 4. Compact areas having cheap, hardworking and labour force. 5. Adequate availability of raw material for processing industries. 6. The activity will encourage the export of fruits, vegetables which will provide better returns to the farmers as well as foreign exchange. 7. The approach will also be helpful in minimizing the post harvest losses during the handling of produce. 	<ul style="list-style-type: none"> 1. Reduced productivity in the absence of improved technology. 2. Inadequate infrastructure for quality management. 3. Degradation of environmental issues with respect to safe/organic produce for consumers.

Parameter	Strengths	Weaknesses	Opportunities	Threats
Livelihood	<ul style="list-style-type: none"> 1. Market are available for skilled and unskilled labor 2. Most of the farmers are small and marginal. 3. Some households have livestock. 4. Aonla processing is fast-pacing employment opportunity 	<ul style="list-style-type: none"> 1. Lack of awareness regarding pre and post harvest management practices. 2. Lack of proper marketing infrastructure and strong marketing system having forward and backward linkages. 3. Prevelence of traditional cropping systems, substantial increase in area, production and productivity in major crops since last plan period. 	<ul style="list-style-type: none"> 1. Vast opportunity to attract youth towards farming sector. 2. Great opportunities in dairy, farming practices, horticulture, poultry, fruit preservation and other sectors. 3. If provided with livelihood options the income level of the households can be increased livelihood status and Quality of life. 	<ul style="list-style-type: none"> 1. Reduced productivity in the absence of improved technology. 2. Less interest in agriculture.
Micro-Enterprises and production systems	<ul style="list-style-type: none"> 1. People have the basic skills. 2. Organized microenterprise activities exists in the area 3. Natural resources for enhancing microenterprises and production are available in the watershed. 4. Aonla processing is fast-pacing employment opportunity 	<ul style="list-style-type: none"> 1. Lack of management skills. 2. Lack of technical support. 3. Lack of organized marketing facilities. 4. Lack of producer federation. 	<ul style="list-style-type: none"> 1. If provided good technical support and motivation, they can run the units in an organized way and income level will increase. 2. Increase marketing facilities 	<ul style="list-style-type: none"> 1. Farmers may loose interest in agriculture.
Natural Resources	<ul style="list-style-type: none"> 1. Climatic conditions are favorable for flourishing biodiversity and to sustain various existing eco-systems 2. Productive land and flora and fauna. 	<ul style="list-style-type: none"> 1. Depleting groundwater resources 2. Prevalence of soil erosion. 3. No maintenance of water storage bodie, pasture lands 4. Increasing use of chemical fertilizers is deteriorating soil as well water quality. 5. Insufficient fodder to sustain livestock. 6. Extreme climatic events due to climate change are occurring 	<ul style="list-style-type: none"> 1. If used advanced techniques like field bunding and use of organic manure, productivity may be increase. 2. Construction of water storage tank for irrigation. 3. Enhancing micro-irrigation 4. Sustainable groundwater management 	<ul style="list-style-type: none"> 1. Ground water may go down

Parameter	Strengths	Weaknesses	Opportunities	Threats
Soil	1. Availability of good agricultural lands.	1. Susceptible to erosion 2. Increasing use of chemical fertilizers is deteriorating soil, increasing areas of <i>Usar</i>	1. Large tract of alluvial soil in the basin of River Sai 2. Organic matter can be available through various means, the composting is required.	1. Development of soil sickness due over use of chemicals.
Flow of water	1. Good rain fall and perennial river is available. 2. Shallow aquifer due to alluvial geology	1. Local catchment inflow is disturbed by the road. 2. Overdraft of GW for irrigation decreasing GW level	1. Streams can be rejuvenated. 2. Rain water harvesting mechanism, soil water conservation measures are required.	1. More competition for water. 2. If GW depletes, the chances of occurrence of heavy metals pertaining to alluvium geology like Arsenic.
Agriculture	1. Provides income and employment. 2. Has potential to increase productivity. 3. Availability of natural/ man-made resources	1. Lack of organic farming practices. 2. Lack of awareness regarding innovative technique of crop production. 3. Lack of irrigation facilities.	1. If provided with proper irrigation, considerable increase in agriculture production. 2. Increasing demand for organic products. 3. Integrated farming systems can be developed.	1. Dairy and live stock may reduce.
Horticulture	1. Favorable climate for horticultural activities. 2. Good market facility is available for horticultural produce. 3. Aonla, Mango, Guava and other vegetables are already grown,	1. Unavailability of new varieties. 2. Lack of export facilities. 3. Lack of storage facilities. 4. Slow promotion of processing of horticultural produce, value addition and less availability of processing industries in the sector.	1. Availability of good land. 2. Interest of the villagers to expand horticulture activities. 3. Increasing price level.	1. Rapid climate change

Parameter	Strengths	Weaknesses	Opportunities	Threats
Animal husbandry	<ul style="list-style-type: none"> 1. Favorable environment for rearing cow and goats. 2. Many households are engaged in dairy and live stock. 3. Provides income and employment 	<ul style="list-style-type: none"> 1. Lack of fodder availability. 2. Lack of advanced cattle breeds. 3. Low level of milk production 4. Lack of Knowledge base regarding scientific cattle management. 5. Lack of efficient technology in the area specific and technical knowledge at various levels. 	<ul style="list-style-type: none"> 1. Providing more advanced cattle breeds can increase the milk production and enhance their subsidiary livelihood option. 2. Promotion of nursery raising and pasture development will address the lack of fodder availability. 3. Pasture development. 	<ul style="list-style-type: none"> 1. Animal diseases. 2. Excessive grazing on degraded and small community lands.

4.3 Strategic Options: Strategic options for the watershed for developing comprehensive sustainable watershed development plan-

Sr.No.	Objective	Strategic options
1.	Judicious use and management of water	<ul style="list-style-type: none"> Continuous fall in the level of groundwater needs to be arrested. Harnessing rain water for irrigation and recharging by means of constructing rain water harvesting structures like CB, Chek Dam & Tank etc. Optimal use of the potential by modernization and rehabilitation of irrigation projects – promotion of water-smart technologies for irrigation like sprinkler, drip, piped underground irrigation system etc. Providing proper drainage options. Data keeping for groundwater level and rainfall by Gram panchayat.
2.	Maintaining safe drinking water	<ul style="list-style-type: none"> Use of deep aquifer for drinking water as shallow aquifers are polluted with hazardous elements. Regular chlorination of drinking water sources. Time to time checking of groundwater quality, abandoning the polluted / hazardous sources.
3.	Improve problematic land	<ul style="list-style-type: none"> Reclamation of <i>salinity</i> affected land. Pasture development, fodder development on barren, waste lands to increase fodder availability and also to check soil erosion. Soil & water conservation measures to check on soil erosion and also to improve in-situ soil moisture.
4.	Improve soil health for sustainable production	<ul style="list-style-type: none"> Strengthening of district soil testing labs and establishing labs at tehsil/block level. Promotion of balanced use of fertilizers, micro nutrients and IPNM & IPM. Promotion of green manuring, NADEP/Vermi compost, Bio-fertilizer and soil amendments to restore soil health. Soil & water conservation measures to check on soil erosion and also to improve in-situ soil moisture.
5.	Ensure availability of quality seeds	<ul style="list-style-type: none"> Ensure availability of foundation / certified seeds Increase in seed replacement rate (SRR). Seed multiplication and production programmes with local farmers. Formation of farmer groups for creating seed banks. Establishment of new seed processing units, seed testing lab at block level.
6.	Major genetic breakthrough	<ul style="list-style-type: none"> Development of suitable varieties/cropping systems responsive to climatic changes with focus on thermo-insensitive varieties. Short and medium duration high yielding varieties of various crops for rainfed condition. Development of high yielding & disease resistant varieties in pulses/oilseeds.
7.	Enhancement of productivity of agricultural crops and vegetables production	<ul style="list-style-type: none"> Promotion of agronomic practices like System of Crop Intensification (SCI) Judicious use of organic and inorganic fertilizers. Promote intercropping for better yield. Emphasis on non-cereal production and promotion of diversification. Provide mini-kits of improved variety of seeds. Train farmers for off-seasonal vegetables and raising low-tunnel nursery. Partnership with other sectors for better facilities, infrastructure, market,

		better price returns, compensation mechanism etc.
8.	Enhance – Horticulture	<ul style="list-style-type: none"> • Set up more plant nurseries for budded & grafted saplings. • Application of technology advancements for pre, post harvesting. • Promotion of storage facilities.
9.	Improvement in marketing facilities	<ul style="list-style-type: none"> • Encouraging private investment for supplying inputs, extension services, supply chain, food processing ,retailing and agro based industries • Remunerative prices to farmers commensurate with cost of cultivation
10.	Enhance mechanization and technology development	<ul style="list-style-type: none"> • Provision of custom hiring centers through Kisan Vidyalaya, Kisan resource centers or entrepreneurs • Popularizing new-age low cost technology instrument • Creating mass awareness and delivering training/orientation workshops, Organizing Kisan mela for promotion of new technologies
11.	Converting small and marginal farmers in profit making units	<ul style="list-style-type: none"> • To organized small and marginal farmer in productive and profit making units like SHGs, FPO etc.. • Implementation of all agricultural programs through these groups. • Improving skill of farmers by training and exposure visits. • Promotion of Integrated Farming Systems (IFS) by combining agriculture based other livelihood avenues.
12.	Effective risk management	<ul style="list-style-type: none"> • Fewer subsidies on premium under crop insurance schemes. • Strengthening compensation mechanism in case of loss due to natural calamities • Time for settlement of claim should be minimized. • Need of proper training and awareness programs for farmers.
13.	To improve animal health and productivity	<ul style="list-style-type: none"> • To insure availability green fodder. • Increase effective coverage of Artificial Insemination(A.I.) programme. • Establishment of new veterinary hospital. • Strengthening veterinary education and services through cadre of local trained youth, forming network of para-workers etc. • Training and skill up gradation. • To reduce/remove infertility.
14.	Promotion of small scale enterprises and home-based business for asset less families	<ul style="list-style-type: none"> • Scope for development of dairy, poultry, goatry as a profit making avenues • Dairy development – need of chilling plant and milk processing unit • Development of Poultry hatchery at block level or nearby town • Establishment of breeding farm for goats, sheep etc. • Increase market accessibility and visibility with the help of ICT tools.

Chapter 5: Recommended management programme

5.1 Arable land (rainfed/irrigated)

5.1.1 Agronomic practices

- i. High yielding variety
- ii. Major crops proposed/rotations/cultural operations/recommended conservation practices/proposed manures and fertilizers, green manuring
- iii. Use of improved implements
- iv. Plant protection measures
- v. Yield and cost of cultivation of major crops
- vi. Irrigation

5.1.2 Engineering measures in arable land (Class wise i.e. I, II, III and IV)

- i. Proposed measure and its justification
- ii. Specification of individual measures with plan and design calculation
- iii. Drawing with plan, section, elevation may be give
- iv. Estimate of the work

Note: Engineering design of each work will include hydrological design, hydraulic design and structural design

5.2 Non Arable land

5.2.1 Agronomic practices of Orchard and plantation

- i. Type of orchard/plant with spacing, pit size, soil working and planting
- ii. Fencing type
- iii. Management practice
- iv. Cost of raising orchard/plantation
- v. Yield.

5.2.2 Engineering measures in non arable land

- i. Proposed measure and its justification
- ii. Specification of individual measures with plan and design calculation
- iii. Drawing with plan, section, elevation may be give
- iv. Estimate

Note: Engineering design of each work will include hydrological design, hydraulic design and structural design

5.2.3 Diversion drain/interceptor drain/grossed waterway

- i. Alignment of each drain to be shown on map
- ii. Design (cross section of each)
- iii. Estimate

Note: Engineering design of each work will include hydrological design, hydraulic design and structural design

Chapter 6: Proposed interventions

6.1. Soil management and landuse

Deteriorating soil health is a serious problem in project area. Not only the organic matter which is low but also imbalance of major nutrients NPK and micronutrients has telling effect on crop yields. The large part of cow dung is being used as fuel and not for farmyard manure. To improve upon the soil health and nutrient imbalances, two components are proposed:

- Improving soil health through green manuring.
- Demonstrating nutrient management through Integrated Nutrient Management (INM) system.

Above two components are proposed to be run as given below:

(i) Enrichment of organic carbon content using green manuring

- Green manuring can be an important intervention to cope up with the problem.
- Green manure crops such as daincha, sunhemp, and cowpea etc not only fix nitrogen but also add organic carbon. It is proposed to provide seeds of green manure crops to selected farmers.

(ii) Establishment of Integrated Nutrient Management (INM) system

Balanced use of plant nutrients is essential for sustainable intensification of agriculture. The goal of INM is to promote balanced use of plant nutrients, so as to increase crop productivity in an efficient manner. Few demonstrations of 0.40 ha will be conducted in every gram panchayat.

6.2. Efficient use of water resources and management

Since the availability of water supply is the major constraint in the project area, there is an urgent need to promote water conservation and efficient on farm water management practices to improve the productivity per unit of water consumed. Under this programme the following components are proposed:

(i) Adoption and promotion of precision farming techniques through micro irrigation

Micro irrigation system enhances irrigation and water use efficiency. It also helps in increasing the fertilizer use efficiency. Being one of the main components of precision farming, it can be of great help for small and marginal farmers. Under capacity building module this component will be addressed.

(ii) Demonstration cum training of ridge and furrow system and SRI of paddy cultivation for increasing water use efficiency and eco-friendly cultivation

Paddy is generally cultivated in puddle fields and is transplanted in standing water. Recently a new technique “transplanting of paddy seedlings on both sides of ridges under non puddled conditions” has been reported to have given good yield with only 50 percent quantity of water use along with efficient utilization of added plant nutrients and better micro-climate which reduces the incidence of pests and diseases. Also, this method improves the soil texture and soil health, with lesser pollution of ground water. The weed problem under this technique can effectively be controlled with the use of new herbicide (s) and with no residual effects on succeeding crops. In this method, bed planter is used for preparing ridges on well-prepared field. Three to four weeks old seedlings of paddy are transplanted on both sides of ridges, keeping a distance of fifteen centimeters between the seedlings, ten centimeter above the

bottom of the furrow. Thus 33 seedlings per square meter will be maintained as in case of conventional transplanting. It is proposed to conduct demonstrations of this technology to convince the farmers that water can be saved in paddy cultivation without compromising with the yield. Similarly SRI will be useful to save water and fertilizer without compromising crop yield. Each gram panchayat will be provided a bed planter for conducting demonstrations and a total sum of Rs. 30,000.00 shall be spent on each of such trainings.

6.3. Seed and planting material

Seed is the most crucial agriculture input for improving the production and productivity of crops. Better seed replacement ratio coupled with proper seed treatment can largely contribute to improve the yield of crops per unit area. Similarly availability of high quality planting material for horticulture crops can improve their productivity. The following interventions are proposed to be taken up under this programme:

(i) Establishment of seed treatment and demonstrations units at gram panchayats level for early and high germination rate to increase crop yield

The concept of seed treatment is the use and application of biological and chemical agents that control or contain primary soil and seed borne infestation of insects and diseases which pose devastating consequences to crop production. Seed treatment ensures crop safety, leading to establishment of healthy and vigorous plants resulting in better yields. The benefits of seed treatment are as follows:

1. Increased germination
2. Ensures uniform seedling emergence.
3. Protect seeds or seedlings from early season diseases and insect pest thereby improving crop emergence and its growth.
4. Improved plant population and thus higher productivity.

Presently, 70% requirement of seed is met from the farmer's own stock which goes for sowing without seed treatment. The demonstrations and training on seed treatment will be conducted at gram panchayat level. The demonstrations will be conducted in 0.25 ha area and the farmers will be trained simultaneously on the techniques of seed treatment. Component of seed demonstration unit are:

Item	Area/Number	Cost in Rs
Fungicides	0.4 ha	50
Seed treating Drums	One	1150
Operational Charges/ demonstration (Rs. 2000 /demonstration)	0.4ha	2000
Total	-	3200

(ii) Production and supply of quality seeds and planting material for improvement of seed replacement rate (SRR)

The major field and horticultural crops of the project area are wheat, potato, pulses, rice and vegetables, where replacement of seed and planting material can boost the production and productivity. This programme is required to be takenup in a project mode. Except for hybrids maize, rice and vegetable crops, the farmers can produce the certified seed/ foundation seed stage-2. It is proposed that the farmer may get his crop inspected, so

that instead of certified seed, he is able to produce foundation seed stage-2 so as to meet the desired seed replacement requirement. The government may provide foundation seed to one fifth of the farmer every year. The seed produced by these farmers will be supplied to the next group of farmers during subsequent years.

To support nutritional kitchen garden as well as production of high value crops by small and marginal farmers, special emphasis is required to be given to provide high quality vegetable seeds to the farmers.

(iii) Seed replacement

Seed is the single most critical input in production. High quality seed is likely to increase production by 10 -15 % with following additional benefits:

- Quality seed and planting material will become available to the small and marginal farmers particularly of high value crops to boost their profitability.
- The seed borne diseases and insects can be controlled at a minimum cost by seed treatment and it is expected that farmers of all strata will be benefited and their income shall be raised by 10 - 30 %.
- Proper management of insect pest and diseases by seed treatment will reduce environmental pollution.
- High quality planting material will result in better quality of horticultural and agricultural produce, thus higher returns to the farmers.

6.4. Technology dissemination

The present agriculture extension system is not designed to meet out the integrated requirement of the farmers. It is required that for reaching out every farm unit a new programme *i.e.* based on information and communication technology (ICT) be adopted. The outline of the programme is given here under:

(i) Publication and mass campaign for resource development of agri and allied sector using ICT

The publication, training and mass campaign system has a vital role in the overall development of agriculture and allied sector. According to the multidimensional needs of the farmers, the publication, awareness and mass campaign with the full support by training will provide extra and latest information to the farmers in their respective fields as and when required. Therefore, to make timely available and proper use of printing materials and electronic media related to every modern technology can be passed on very quickly up to the grass root level (learning by doing and seeing by doing) and to cover every village of the entire project area.

(ii) Farmers study tour within and outside the state for exposure and motivation towards commercialized agriculture

In order to induce competitive instinct in the minds of farmers of lesser developed areas, it is essential to expose them to well developed pockets of U.P. in first stage. These visits will strengthen the confidence of farmers in new technologies and see the practical adoption of new technologies.

Personal interaction and listening to success stories from horses mouth will change the mind set and to adjust the changes in their own package of practices. In district the progressive farmers will be included in the proposed study tour. Various agriculture segments for improvement will be selected like: fish culture by visiting East U.P; higher production of potato from success story of Kannauj/Farrukhabad/Agra, etc; better mechanization of farms of West U.P. Additionally farmers could also visit other states like: Maharashtra & Valsad (Gujarat) to see the organized mango cultivation, Nasik for grapes and onion, Stara for ginger cultivation, and Haryana/ Punjab/ Gujarat for dairy etc.

(iii) Training and demonstrations of weed management in major crop to reduce the yield loss

The association of weed with the crops is well known because weeds compete with the crops for various growth factors like light, space, nutrients, moisture etc. The competition of weeds reduces the crop yield from 15 to 25 percent depending upon the type of weed flora, its intensity and duration of competition. The introduction of dwarf genotypes with the high inputs use like fertilizers and irrigation requirements has further aggravated the weed problems. The project will consist of training and demonstrations on chemical weed control in major crops of the region.

(iv) Farmers training for seed production at *Krishi Vigyan Kendra*

KVK/ KGKs/RIRD are very prestigious units/Institution in the district, which provides latest production technology to the farmers by different ways. To provide latest information and training to the farmers, it is necessary that KVK/ KGK/RIRD are kept up to date, so that, farmers can utilize their services and advise and adopt latest techniques on their own farms.

6.5. Farm mechanization

Farm mechanization plays very vital role in timely and precision performance of different farm operations. In areas of intensive agriculture i.e. where two or more than two crops are taken in a year, use of machinery can greatly enhance the productivity by timely performance of various agricultural operations and thereby improving the input use efficiency. But, this is the most capital-intensive agricultural input. The various interventions proposed are as follows:

(i) Demonstration of farm mechanization at gram panchayat level to minimize the energy loss of human resources

Interaction with village panchayats in the project area revealed that there is need to make available farm machinery to small and marginal farmers. However, they cannot afford to purchase costly farm machinery as it will not be economical for their smallholdings. Further lack of farm machinery at small farm brings drudgery on farm women. To meet the requirement, village level cooperative societies or farmers clubs, or entrepreneur will be encouraged to purchase the machinery and made will be made available to the farmers on custom hiring basis.

6.6. Horticulture

(i) Promotion of protected cultivation of vegetable crops under low tunnels for early production of vegetables

Majority of farmers in project area are small and marginal and their holdings are uneconomical. If provided with capital support and know how, they can compliment production of cucurbits out of main season in protected structure like low tunnels. The cost of material for erection of low tunnels including plastic for one hectare is Rs. 50,000. Small and marginal farmers have very small holding and it is expected that not more than 500 sq mt areas shall be put under plastic tunnel at one time. The cost for 500 sq mt. per farm unit works out to be Rs. 2500.00.

Objectives:

To start early crop of vegetables when the season is still cool will help off-season production of vegetables for higher profits. The productivity of vegetables is very high in the region which will increase cash flow to farm women. Insect – pest and disease management can be done more efficiently. Vegetable being high value crops, a better protection from weather conditions ensures crop safety and safeguards against crop failures. Higher vegetable production leads to better nutritional security. Use of low tunnels for raising nurseries of winter vegetables under protection ensures production of quality planting materials and safeguard for expensive composite seed.

(ii) Demonstration and supply of healthy nursery raising in vegetable crops

Vegetable crops including onion, cole crops, capsicum, chillies, tomato and brinjal are raised through nursery. All these crops are high value and highly productive. They suit to small and marginal farmers and especially it is the women who take care of vegetable production. Healthy nursery of these vegetables ensures the success of vegetables production venture. It is therefore proposed to train the farmers on the practices of raising healthy nursery.

Objectives

- To raise healthy nursery of the high value crops through high quality seed to ensure crop success.
- To provide quality-planting material and costly seeds i.e. hybrids.
- To boost the income of small and marginal farmers.
- To increase cash flow to farm-women through raising quality nursery of vegetables crop for own use and for sale to other farmers.

Technology

Small raised beds of 3 meter x 1 meter x 10 cm are prepared. Well rotten FYM or vermi-compost is added to each bed. The beds are drenched with formalin solution (1 part formalin and 7 part water). After doing so the beds are covered with polythene sheets and left as such for one week, so that, formalin fumes get deep in to the soil and it is sterilized properly. The covering with polythene also ensures solar sterilization of soil. After one week the polythene is removed and the soil is raked number of times for at least one week, so that, formalin fumes are completely driven out. As a check, a handful of soil is taken out from the bed and smelled to feel if there are any fumes of formalin smell left in the soil. Just in case, if the soil still smells of formalin it should be left for another two- three days and further raking

of soil may be done. Normally, it takes 2-3 weeks time to prepare the nursery bed and sterilized them for sowing of seeds. Therefore, bed preparation programme should be started at least three weeks in advance of actually planting the seeds in nursery beds. Since the vegetable seeds particularly hybrids are very costly, healthy nursery is very important. Further, it should be kept in mind that the seeds are sown in line and it should not be congested. If required low plastic tunnels can be prepared to protect valuable nursery seedlings.

The cost of raising ten nursery beds each of 1m x 3m diameter is given here under:

Hybrid/OP seeds, formalin, FYM, vermicompost, fertilizers, polythene sheets, polytunnels	Rs. 5000
Fifty man days for preparation of beds and nursery-raising for one month	Rs. 5000.
Total	Rs. 10,000

(iii) Development of nutritional kitchen garden/back yard garden for balanced nutrition at village level and involvement of women in horticulture.

Rural people particularly women and children suffer from lack of vitamins and minerals. Nutrition garden can play an important role to solve this problem, besides this, nutritional garden also ensure economical and nutritional security. On an average eight member family shall require 2.4 kg vegetables and 800 g fruits per day. This production can be obtained from 500 sq mt. area. Five villages from each block of the district will be selected and one kitchen garden will be laid out in each village each year. They will be provided with input and training to raise the kitchen garden. Besides seed kits of summer and winters vegetables, three fruit trees (amrapali, papaya, citrus and guava) shall also be distributed to each.

6.7. Commercial fruits

(i). Promotion of rejuvenation of senile, old and unproductive orchards of Aonla, Guava, and Citrus

PRA survey reveals that quite a good percentage, about 20-35% of orchards are unproductive in the project area. Due to this, the productivity of these fruit crops in the region is quite low (6.2 tons/ha). Therefore, rejuvenation of such orchards is required on priority to increase productivity, ensure export competitiveness and to take advantage of global opportunities. The technology of rejuvenation of both Aonla, and guava is given below:

(a) Aonla: Rejuvenation of Aonla gives a new productive life of 15-17 years. Like other fruit crops, Aonla trees also witnesses decline in productivity after certain age and orchards become unviable. The technology of rejuvenation has been worked out and demonstrated by Central Institute for Subtropical Horticulture (CISH), Lucknow. The technology aims at pruning of undesired branches for inducing development of umbrella like open canopy of healthy shoots which ensures better light penetration and improves flowering and fruiting potential. Pruned trees attain canopy of healthy shoots in two years time and after three years onward they start bearing fruits. The technology involves pruning of undesired branches from a height of 4-5 meters from ground during month of December. Four to medium sized branches with outward growth are retained for basic framework of tree for the development

of canopy. Other criss-cross, intermingling, dried and diseased branches are marked for complete removal, which is also done in month of December. Branches for canopy development are pruned at a distance of about 75 cm at their base.

Immediately after pruning, fungicidal paste should be applied on cut surfaces to check microbial growth. It is observed that alternate row pruning is much more acceptable to growers as there is less economic loss and the availability of better light to un-pruned adjacent rows which greatly increases their fruiting potential. Apart from this, pruned trees are to be provided intensive care of nutrition, irrigation and management of insect, pests and diseases. Five to six months after pruning, outwardly growing 8-10 healthy shoots need to be retained per branch. This operation is done during June to August. If the orchard is of inferior variety, then the branches (new shoots) can be grafted with improved variety, which is called as “top working”. Pruned trees have been found to have 2-3 times higher average yield than the control plot in which pruning is not done.

(b) Guava: The unproductive old orchards which produce low-grade fruits need to be rejuvenated through heavy and systematic pruning followed by proper nutrition, irrigation and plant protection measures. Heading back of unproductive guava orchards is done in the month of May followed by judicious thinning and pruning of newly sprouted shoots in the month of October. The newly emerged shoots after October pruning are found to be very conducive for flowering and fruiting in the following season.

(c) Citrus – Citrus is another fruit crop which has favorable conditions in Pratapgarh and hence to be promoted on commercial basis.

Assistance under National Horticulture Mission (NHM)

This activity has been adopted by NHM and assistance norms are 50% of the estimated cost of Rs. 30,000/ha subject to a maximum of Rs. 15,000/ha limited to 2 hectares per beneficiary.

(ii). Promotion of high density planting of guava fruit crops

Although India is the largest producer of guava, however yields are very poor varying from 6.2 tons/ha in mango and 11.0 ton/ha in guava. The main reason for low yields are wide spacing, low penetration of improved varieties and poor management practices. Even countries like Brazil, Mexico and Egypt harvest yields up to 9.2 tons/ha to 16.0 tons/ha in mango. It is a common practice to plant guava at a spacing of 8m × 8m between rows and between plants within rows. With the wider spacing it takes 7-10 years to fill the space between plants. Thus there is tremendous scope for increasing orchard productivity by increasing planting density. Along with high planting density, early height control and canopy management are essential to control vegetative growth and to achieve desired results. Researchers conducted at Central Institute for Subtropical Horticulture(CISH) at Lucknow has revealed that a spacing of 6.0m × 3.0m is most favourable. In this case also, yields of the order of 15-16 tons/ha can be easily obtained with Allahabad Safeda variety.

6.8. Proposed intervention for livestock

The livestock sector is an important sector of agricultural economy of the state and accounts for about one fourth of the net state domestic product. The opportunities in

improving the performance of this sector are much more as compared to crop sector as the farmers are already practicing dairy and backyard poultry to supplement their income.

To increase the productivity in animal sector the major contribution rests on the genetic up-gradation of livestock. So far as dairy development is concerned, induction of additional milch animals and transforming the backyard dairy units into commercial dairy farms with minimum ten animals is required. Farmers training for better herd and milk management need to be done through latest techniques and farm practices.

(i) For year round production of green fodder to

It has been realized that seed is the most limiting factor in fodder production. The fodder crops being very shy seed setters, sufficient quality of good seed is not available. In the present situation, the berseem seed costs approximately Rs. 100 /kg and 20 kg seed is needed for one hectare. Accordingly following norms for fodder seed production and seed acquisition by the government for further distribution will be followed. Barseem seed will be distributed to registered farmers having mixed farming system @ 4 kg / farmer costing Rs 400.

(ii) Cattle shelter

Cattle shelter will be provided under MGNREGA fund.

(iii) Promotion of Goat Rearing

Goat rearing is common in almost all gram panchayat in project area. Goat is used both for milk and meat purpose by the people. During last five years 90% of meat consumption in the district comes from goat. There is a need for promoting goat rearing. To promote goat rearing goat shelter will be provided.

(iv) Dairy Training Workshop for Women

The first step will be to sell the idea of dairy farming aggressively in the target area. This will be done by holding dairy training workshops extensively in the district, so as to cover the entire area repeatedly. These will be high tech camps wherein the requisite message will be passed across the audience in a very cordial, conducive and friendly environment. Dairy training workshop will be conducted to encourage and equip with knowledge to prospective dairy farmers and 50 percent target beneficiary should be women.

[1] Average production value for all Kharif crops is Rs. 37000/ha, Rabi crops @Rs. 41000/ha and Zaid crops @Rs.87000/ha per annum. Refer Annexure I for detail calculations.

[2] Expected increment in production is 25%, 30% and 35% respectively in Kharif, Rabi and Zaid seaon.

[3] Average production cost is Rs.32000/ha, Rs.37000/ha and Rs.80000/ha for Kharif, Rabi and Zaid season resepctively. Refer Annexure I for detail calculations.

[4] Expected rise of 30% in production cost.

Chapter 10: Consolidation and post-project management

Watershed development projects can render sustainable production through the execution of rain water management programme with appropriate combination of environmental balance, community participation and institutionalization of process. The strategic planning for the post project management is elaborated as under:

10.1 Activity of consolidation and post project management phase

SL. No.	Activity
1	Preparation of project completion report
2	Preparation of GPS based inventory of developed infrastructure
3	Documentation of success stories
4	Preparation of feed back and suggestion note for watershed commitee
5	Documentation of procedure for management and utilization of infrastructure developed under the project
6	Documentation of procedure for mainetnance of infrastructure developed under the project
7	Documemtation of utilization of watershed development fund (WDF)
8	Documentation of quality and sustainability issues

10.2 Adoption of eco-friendly conservation measures

The conservation measures taken up in the watershed should be long lasting with sustainability. Along with engineering measures, efforts would also be made to reinforce the vegetative cover around the earthen structures, on the slopes, on bunds, and on barren lands through protection of the process of natural regeneration and by planting appropriate vegetation with combination of grass/shrubs and trees. The stream banks would also be vegetated and stabilized to create a buffer zone between land and water body. Such vegetation and physical measures helps in stabilizing streams banks, augmenting ground water recharge and improving the riparian habitat.

The diversity of watershed development measures is the key to sustainability. Combination of drainage line management, agro-horticulture and forestry measures including plantation of shallow and deep-rooted plants, fast and slow growing plants, productive and medical plants and herbs will be encouraged. The watershed development measures will ultimately help recharge the rainwater to the ground water, improve soil moisture optimally and provide tangible and intangible benefits to the community and environment as a whole.

Land use pattern will go hand in hand with carrying capacity of the watershed. Optimum use of water and increased use of organic fertilizers is the key to conserve the precious land sources. Excessive fertilization and over irrigation leads to permanent damage of soil, land and groundwater. It is important to maintain soil quality through crop management. Crop diversity, intercropping, and crop rotation help in improving the micro flora and fauna present in the soil and maintaining the healthy symbiotic subsystem relationship. Extensive use of measures like Integrated Pest Management (IPM) and Interated Pest and Nutrient Managemnt (IPNM) would be practiced.

10.3 Participation of local community in development and management

During the planning phase the local peoples' participation will be ensured and it is planned that the involvement during implementation and post project maintenance will be

maintained. However, participation without empowerment does not help in achieving sustainable development. Community will be made aware of different concepts and options for their livelihood and natural resource management. Local wisdom is important in understanding rural dynamics that includes the interface between human behaviour and its economic/ecological implications. The interest among the community will be created and maintained by adopting the measures in such a manner that they provide immediate, medium and long term benefits to the community.

10.4 Institutionalization for post project management

A dynamic institutional arrangement is necessary for project management, facilitation of benefit sharing and maintenance of the resources. This is usually achieved through formation of user groups for different resources/assets created as well as through other village level organizations. In-built system and mechanism will be developed for qualitative growth and dynamism of the organizations. The community organizations will be linked to other Government and Non Government institutes of interest. Therefore potential people's organizations would be formed in the project area viz watershed level organization and users groups.

10.4.1 Watershed level committee

Watershed level organization viz; water and watershed management committees will be established right from the beginning of the project. The overall planning, co ordination, management and maintenance are possible through this representative body. This clearly implies representation from different sections of the community – landholders and landless, men and women, thus bringing people from all section of the society, gram panchayat and other existing political or non political organizations.

10.4.2 User Groups (UGs) and Self Help Groups (SHGs)

Few other categories of institutions are formed of various groups with common areas of interest in the project area. These include, depending upon necessity, SHGs of women and men, UGs for common assets, etc. The capacities of different groups will be developed from time to time for effective functioning of the groups. A mechanism will be developed to ensure continuity, both in learning, functioning and actions that form responsibilities of such groups during the implementation project activities.

Annexure I: Computation of profit for various crops based on production cost and production value
